Single and double J/psi production in ICEM via the Parton Reggeization Approach

Wednesday 2 November 2022 16:10 (15 minutes)

We study the prompt single and double J/ψ had roproduction in the Improved Color

Evaporation Model using the Parton Reggeization Approach. We make calculations in a single manner to described the experimental data for prompt J/ψ transverse momentum spectra from the energy of $\sqrt{s} = 19$ GeV up to modern energy of the LHC, $\sqrt{s} = 13$ TeV. The numerical calculations are doing using parton-level MC generator for k_T -depended initial-state partons, KaTie. We use the modified KMR-type unintegrated parton distribution functions of Reggeized gluons and quarks with exact normalization based on Kimber-Martin-Ryskin-Watt model. We suggest improvement of the ICEM for the pair-production of J/ψ . In case of double J/ψ production we investigate the relative contributions of the single-parton scattering and double-parton scattering mechanisms.
