HCAL	9 k

Prompt Reconstruction

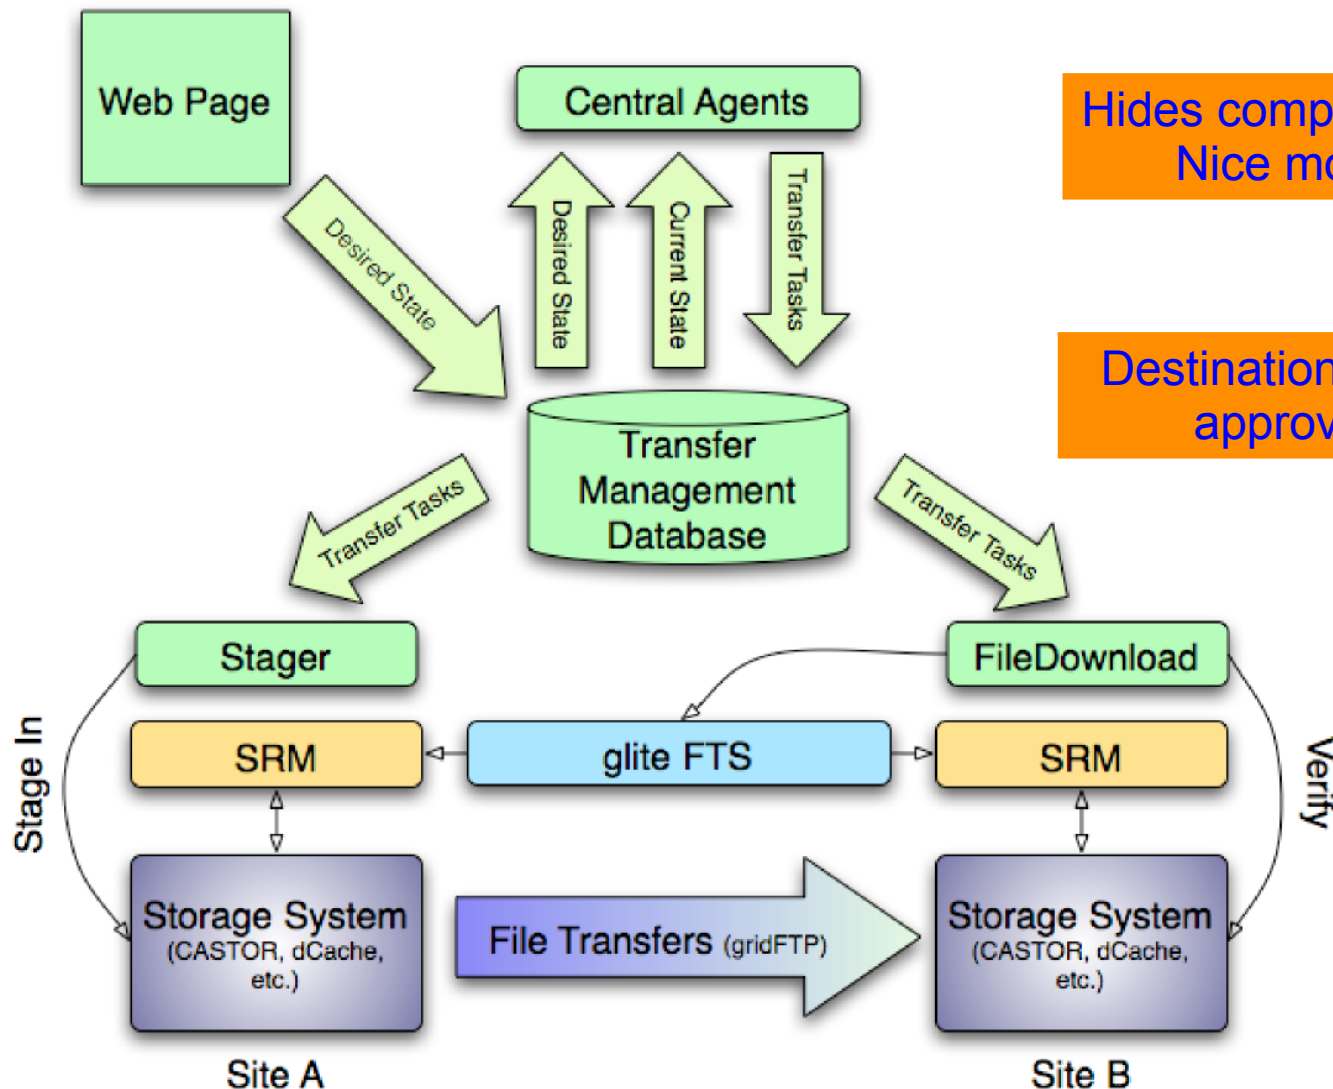

History of CMS Data Transfers.

Average data transfer volume

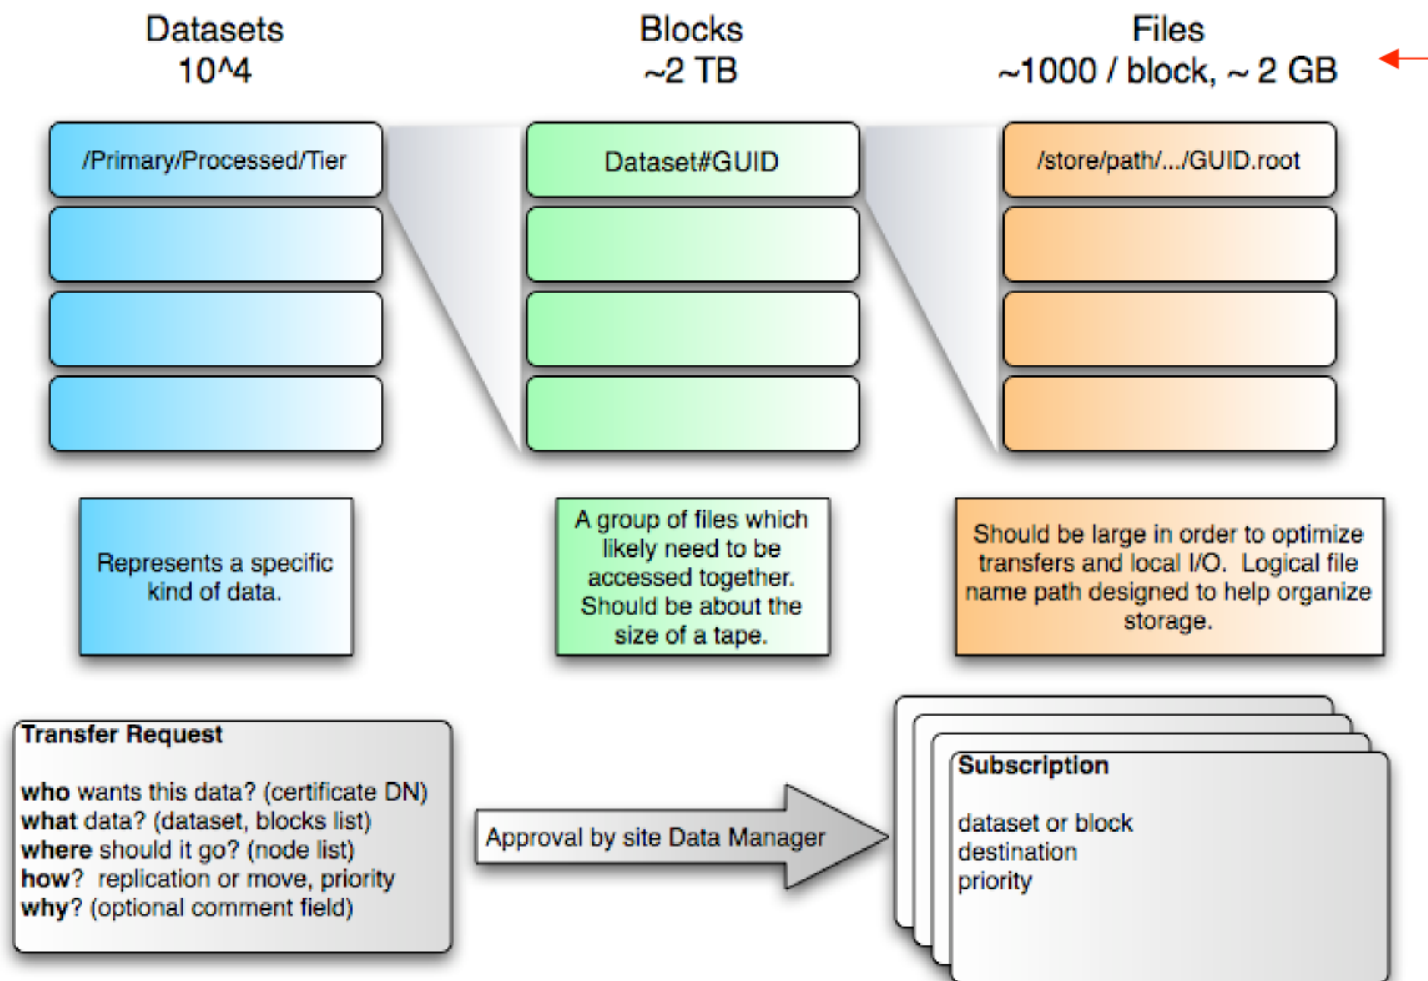

CMS Data Transfer Tool: Phedex.

Hides complexity of FTS
Nice monitoring

Destination "data manager"
approves requests

CMS PhEDEx - Transfer Rate 90 Days from Week 22 of 2010 to Week 35 of 2010

Maximum: 583.37 MB/s, Minimum: 0.51 MB/s, Average: 126.23 MB/s, Current: 0.73 MB/s

Tier-1 to Tier-1 Transfers.

Maximum: 311.58 MB/s, Minimum: 0.18 MB/s, Average: 38.63 MB/s, Current: 0.37 MB/s

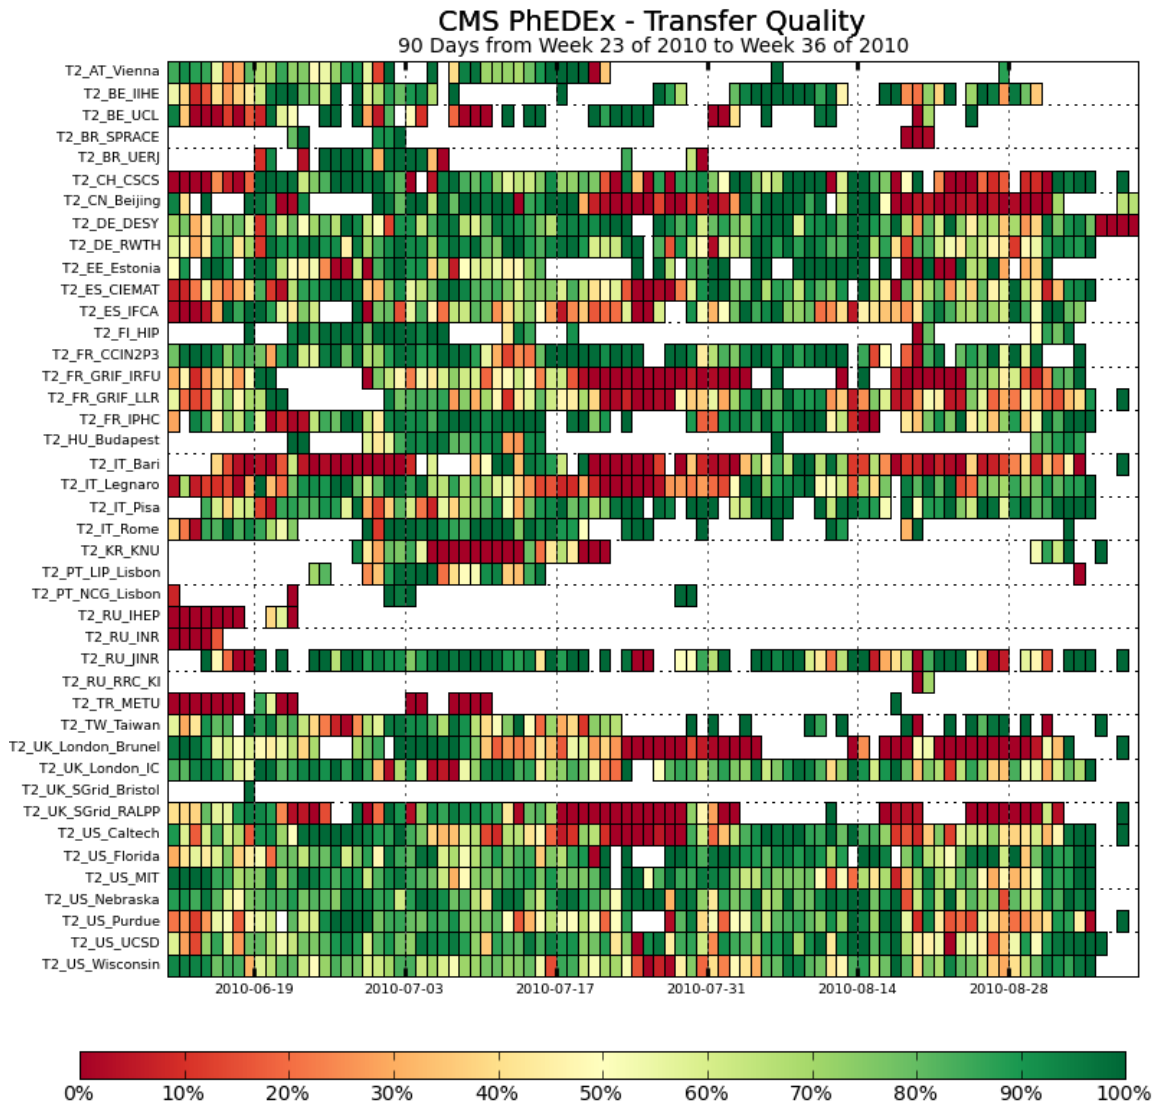

Tier-1 to Tier-2 Transfers.

CMS PhEDEx - Transfer Rate
90 Days from Week 22 of 2010 to Week 35 of 2010

Maximum: 1,407 MB/s, Minimum: 28.45 MB/s, Average: 471.30 MB/s, Current: 98.64 MB/s

Tier-2 to Tier-2 Transfers.

CMS allows T2 to T2

Not as green as
Transfers from/to Tier-1

Organisation of Tier-2 Storage.

Typical CMS Tier-2

Analysis
Operations

Physics
Groups

Local
Community

Local Users
Individuel

- Total Central Space: **2.2PB**
- Good distribution of analysis samples
- Number of replicas ~ attractivity

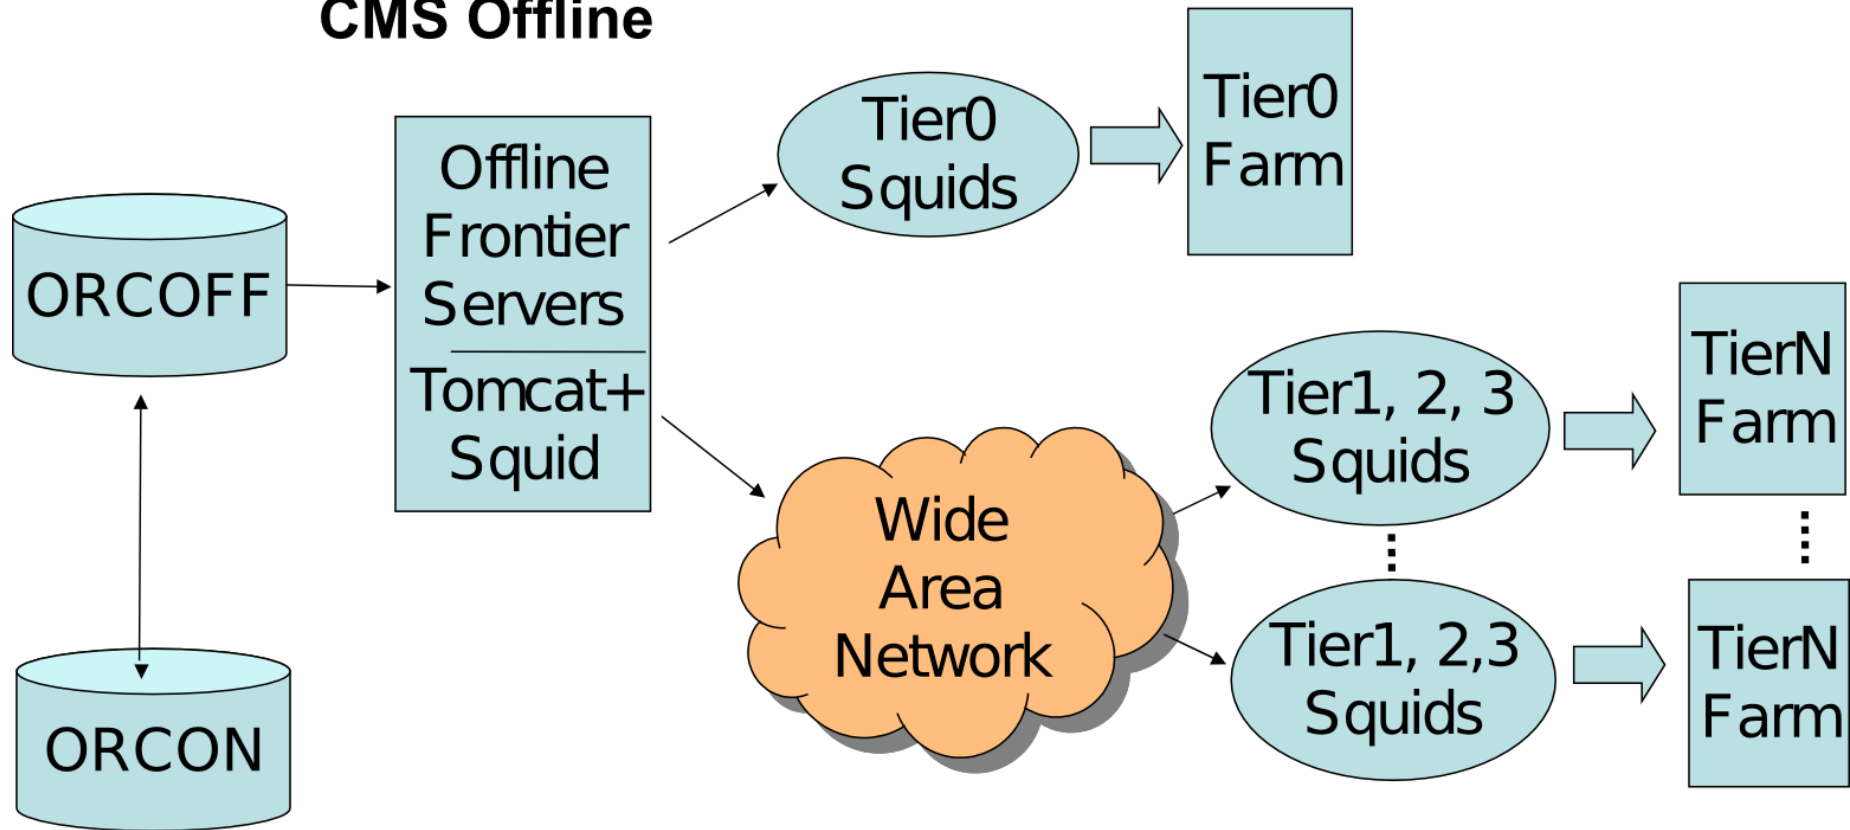

- Each group supported by at least 2 Tier-2 sites
- Total space used by groups: **2.5PB**

- Users assigned to a “home Tier-2”
- 1-1.5TB per user (suggested by CMS)

HTTP Squid Caches

- Rather easy to operate
- Good scaling: Larger sites run several squids

CMS Offline

Data Access Pattern.

Observing Data Accesses (High Level View).

- Typical Monday morning
 - Over 2000 mover
 - WAN + LAN transfer
- Assume 20 servers
 - 100MB/s each
 - 10 GigaBit should be faster
- It's all not easy

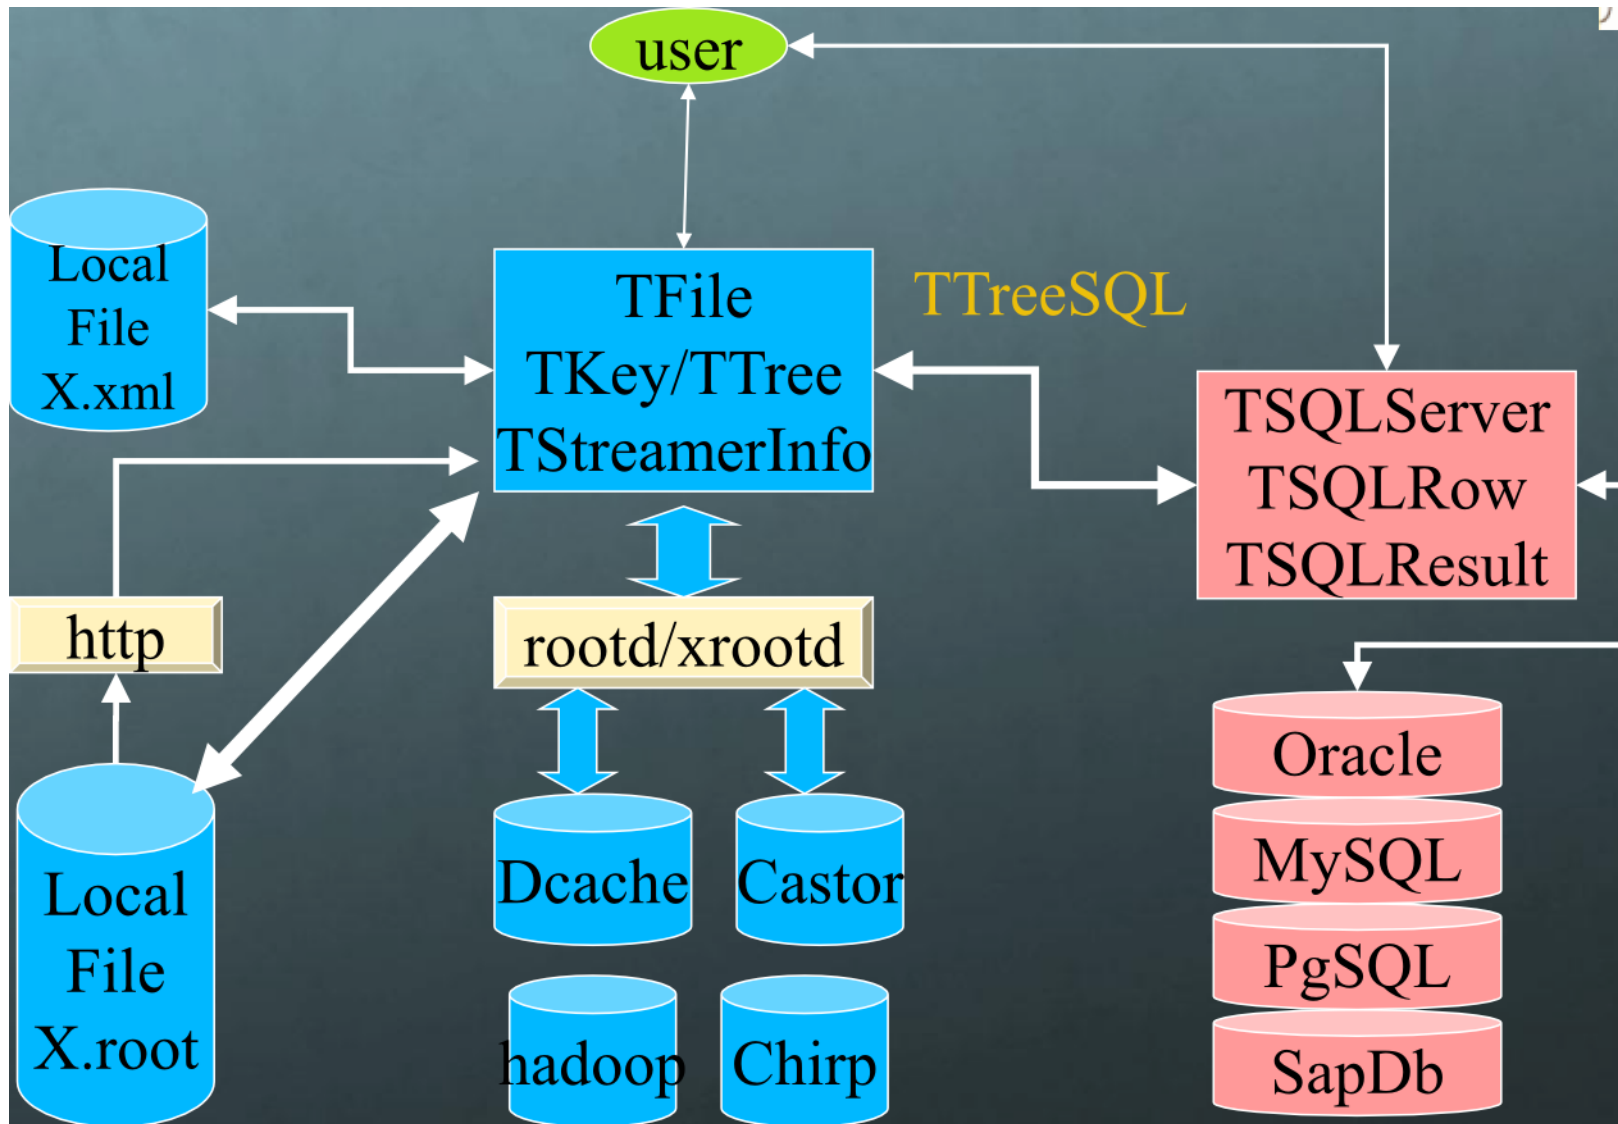

Observing Data Accesses (Lower Level View).

Typical Networkserver:

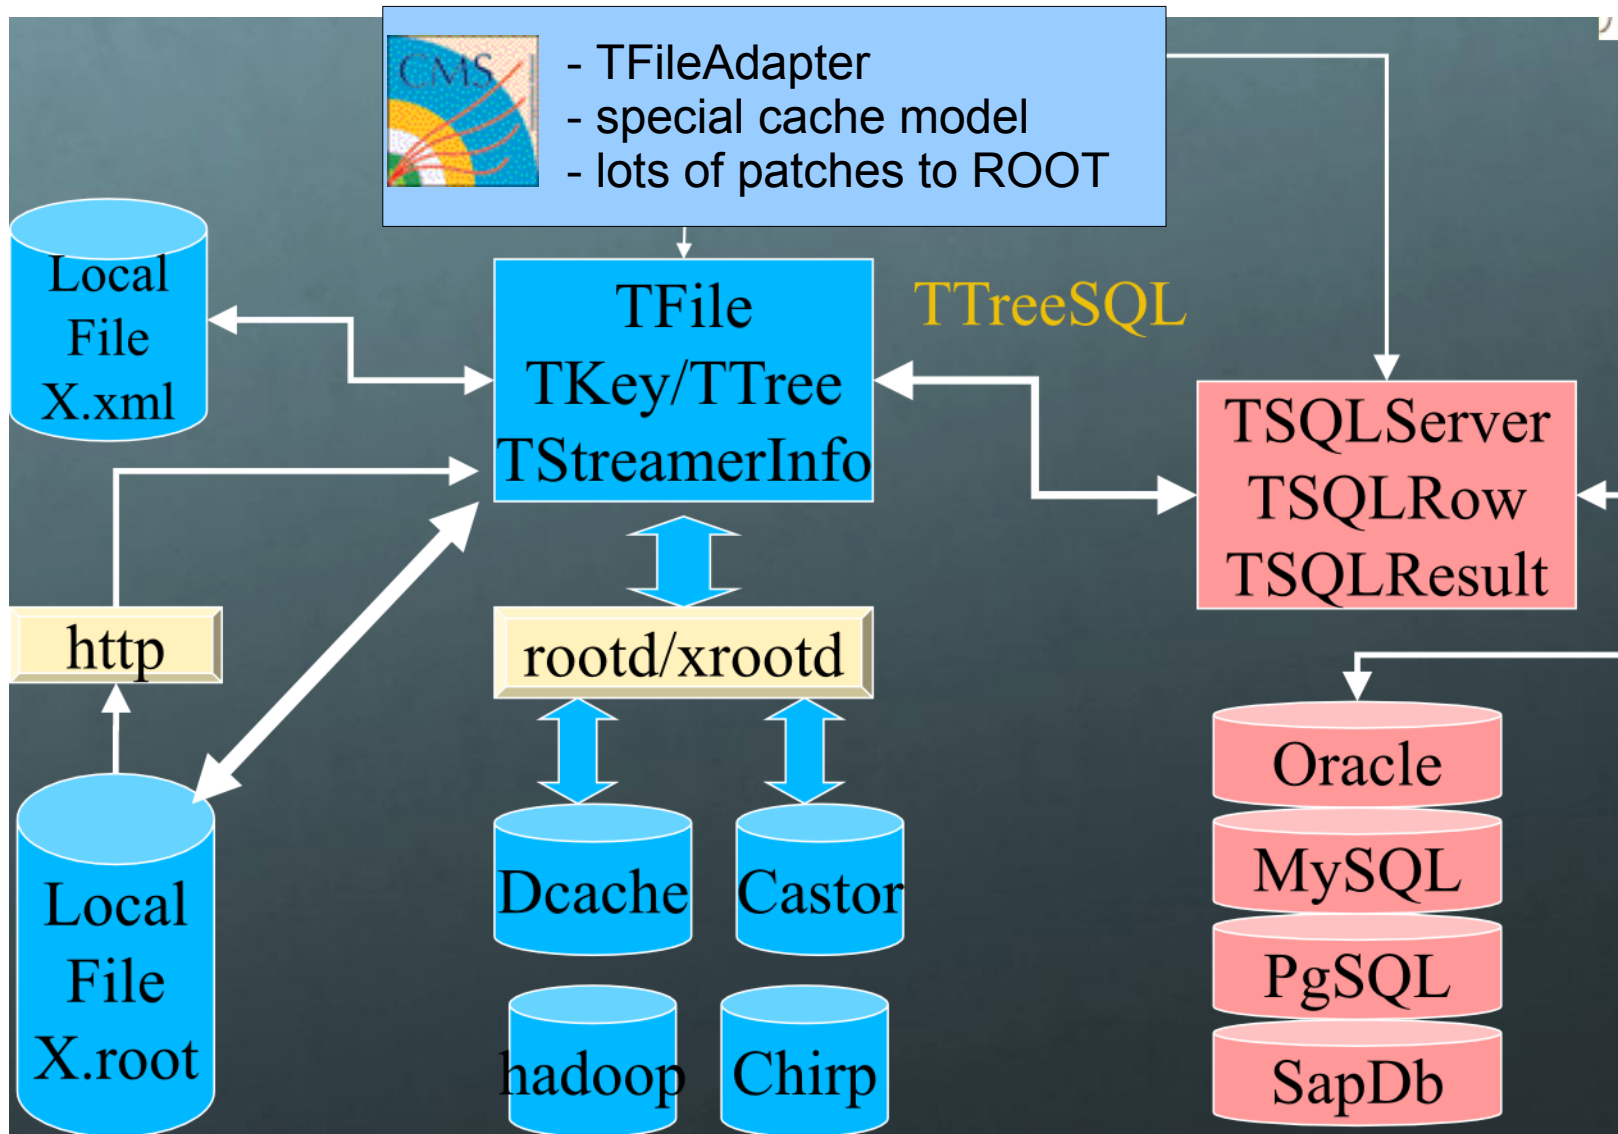

- 1GE Networking
 - ~100MB/s expected
 - “Easy” to saturate
- 10GE Networking
 - Up 1GB/s should be possible
 - Not easy to saturate
 - Bottleneck now somewhere else
 - Underlying storage system
 - Sensitive to RAID setup
- Difficult to tune for all use cases
 - Streaming more easy
 - Seeking due to random access is expensive

ROOT I/O is rather complex....

...but not complex enough for CMS.

- Various parameters in TFileAdapter
- CacheHint
 - Application only: ROOT does the caching
 - “Lazy download”
 - Chunks of several MBs copied to local scratch disk
 - Reading and seeking on local disk
 - Storage only: ROOT only drives the caching, but actually does not
- ReadHint
 - Direct-unbuffered
 - Read-ahead-buffered
 - Buffer size can be configured
- Big parameter space
- No set fits for all storage solutions
- Each job type likes other settings

CacheHint Parameter Matters.

- Experiments move around **Petabytes** routinely
 - Exercised over **many years** in several data challenges
 - Experiment specific tools hide weaknesses of the middleware
 - Rates and volumes of the Computing Models are met
 - Real challenges (with real data) still to come
- Access to conditions data
 - So far **no scaling issues** seen
- Efficient local data access
 - Topic only in the very recent time
 - Difficult on complex infrastructures
 - Will be a **big topic** for the coming years
- **Analysis of LHC data will be also a technical challenge**

Tier-2 to Tier-1 Transfers (MC upload)

CMS PhEDEx - Transfer Rate
90 Days from Week 22 of 2010 to Week 35 of 2010

Maximum: 513.23 MB/s. Minimum: 0.00 MB/s. Average: 95.41 MB/s. Current: 128.08 MB/s
