

# Common Infrastructures

- WG Identity and Access Management

- management of digital identities and federated access (to resources) within and across NFDI
  - creation of blueprints (AARC BPD) for OneNFDI AAI
  - connecting NFDI AAI (and consortia) with relevant initiatives on national and international level
  - consulting and support communities and resource providers to connect to OneNFDI

⇒ basically along our line of thought, needs 'grounding', PUNCH should join

- WG Research Software Engineering

- all software related aspects of the joint development of NF
  - software infrastructure components... as integral part of networked infrastructure
  - software products and digital tools working with research data
  - research software engineering / engineers by providing communication and networking channels

⇒ driven by experiences in scientific software development, but based on their proposal RSE. limiting themselves to advice/support is best outcome. PUNCH should keep in touch (probably join)
