## Probing the CP properties of Higgs bosons via transverse polarization at $e^+e^-$ collider

Wednesday 5 October 2022 15:12 (14 minutes)

In the CP-violating 2HDM, the CP-violating Higgs to fermions couplings can make an additional loop contribution on the Higgs to gauge bosons couplings. In order to address this aspect, we consider a generic model which has the effective CP-violation structure of the Higgs to gauge bosons couplings. We explore the effect of CP-violation term via the process  $e^+e^- \rightarrow HZ, Z \rightarrow \mu^+\mu^-$ , where the angular distribution of muon pair can be sensitive to the CP-violation structure. In particular, the transverse polarization of the initial beams can be applied to single out the effect of CP-violating term compared to the unpolarized or longitudinally polarized beams. We discuss the set-up and the results for the differential cross section and the asymmetries with respect to the CP-odd observables with transverse polarization, at the future  $e^+e^-$  collider with center-of-mass energy 250 GeV.
