Operational Experience and Performance with the ATLAS Pixel detector at the Large Hadron Collider at CERN

Friday 25 August 2023 10:10 (20 minutes)

The tracking performance of the ATLAS detector relies critically on its 4-layer Pixel Detector. As the closest detector component to the interaction point, this detector is subjected to a significant amount of radiation over its lifetime. At the start of the LHC proton-proton collision RUN3 in 2022, the innermost layer IBL, consisting of planar and 3D pixel sensors, had received an integrated fluence of approximately $\Phi = 1 \times 10^{15} \text{ 1 MeV neq/cm}^2$. The ATLAS collaboration is continually evaluating the impact of radiation on the Pixel Detector. In this talk the key status and performance metrics of the ATLAS Pixel Detector are summarised, and the operational experience and requirements to ensure optimum data quality and data taking efficiency will be described, with special emphasis to radiation damage experience. A quantitative analysis of charge collection, dE/dX , occupancy reduction with integrated luminosity, underdepletion effects, effects of annealing will be presented and discussed, as well as the operational issues and mitigation techniques adopted for the LHC Run3.

Collaboration / Activity

ATLAS

Primary authors: ATLAS SPEAKER TO BE ASSIGNED; BATTAGLIA, Marco (Santa Cruz UC); PRIMAVERA, Margherita (INFN Lecce)

Presenter: BATTAGLIA, Marco (Santa Cruz UC)

Session Classification: T12 Detector R&D and Data Handling

Track Classification: Detector R&D and Data Handling
