Investigating collective effects in small collision systems using PYTHIA8 and EPOS4 simulations

Tuesday 22 August 2023 16:20 (15 minutes)

Studies have yielded strong evidence that a deconfined state of quarks and gluons, the quark–gluon plasma, is created in heavy-ion collisions. This hot and dense matter exhibits almost zero friction and a strong collective behavior. An unexpected collective behavior has also been observed in small collision systems. In this talk, the origin of collectivity in small collision systems is addressed by confronting PYTHIA8 and EPOS4 models using measurements of azimuthal correlations for inclusive and identified particles. In particular, anisotropic flow coefficients measured using two- and four-particle correlations with various pseudorapidity gaps, per-trigger yields, and balance functions are reported in pp collisions at $\sqrt{s} = 13.6$ TeV and p–Pb collisions at $\sqrt{s_{NN}} = 5.02$ TeV. The results are compared with the available experimental data.

Collaboration / Activity

Institute of Space Science

Primary authors: Dr DOBRIN, Alexandru Florin (Institute of Space Science); MANEA, Alexandru (Institute of Space Science); Dr DANU, Andrea (Institute of Space Science); Ms BRANDIBUR, Catalina Diana (Institute of Space Science)

Presenter: MANEA, Alexandru (Institute of Space Science)

Session Classification: T05 Ultra-Relativistic Nuclear Collisions

Track Classification: Ultra-Relativistic Nuclear Collisions
