DESY Summer Student Lectures 'Photon Science' July 25 and 26, 2022

Center for Free-Electron Laser Science

Outline

- First lecture (09:15–10:15 on July 25, 2022)
 - Introduction
 - Theory of X-ray—matter interaction
 - X-ray absorption
- Second lecture (14:00–15:00 on July 25, 2022)
 - X-ray atomic physics on computer: XATOM
 - X-ray photoelectron and absorption spectroscopy
- > Third lecture (09:15–10:15 on July 26, 2022)
 - X-ray fluorescence
 - Auger-Meitner decay
 - X-ray scattering

What is X-ray?

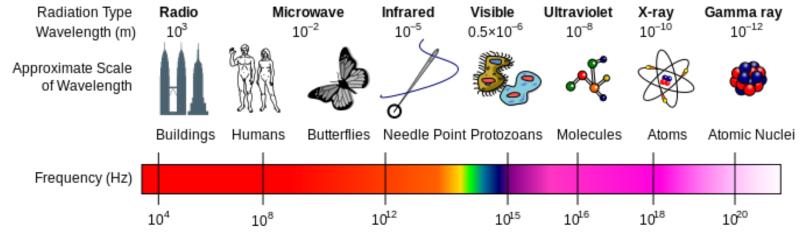

X-ray is...

- discovered by Wilhelm Röntgen in 1895
- photon energy: 100 eV ~ 100 keV
- wavelength: 0.01 nm to 10 nm
- > penetrability
- element selectivity

X-ray absorption

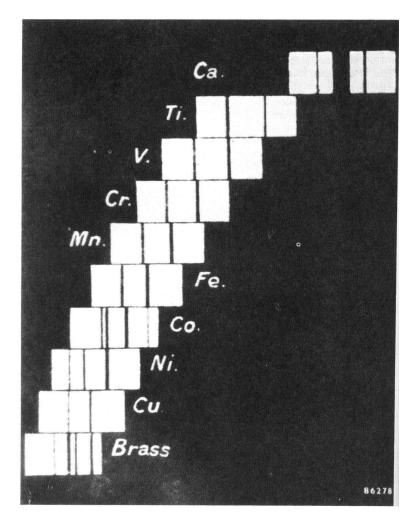

Radiography: see inside due to X-ray absorption contrast

Hand with rings: Röntgen's first medical X-ray in 1895 (Nobel prize in 1901)

X-ray fluorescence

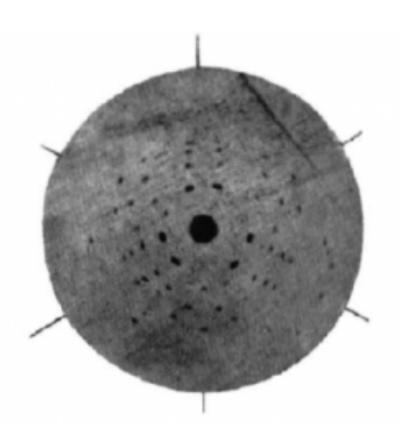

Different chemical compositions identified by X-ray fluorescence

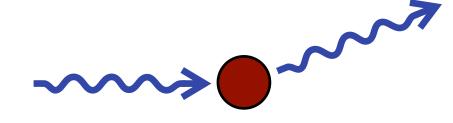

Moseley's Staircase: First qualitative X-ray chemical analysis by Henry Moseley, *Phil. Mag.* **26**, 1024 (1913).

X-ray scattering / diffraction

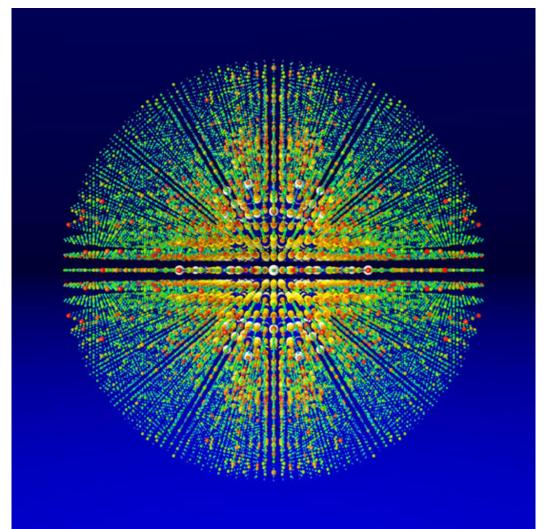

Elastic X-ray scatterings from a crystal make a diffraction pattern.

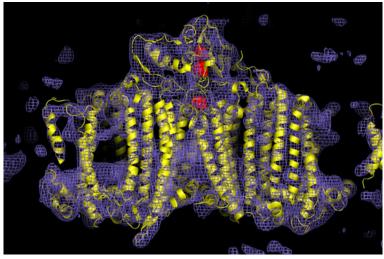

Zinc blend: First published diffraction pattern of a crystal by Max von Laue in 1912 (Nobel prize in 1914)

X-ray crystallography

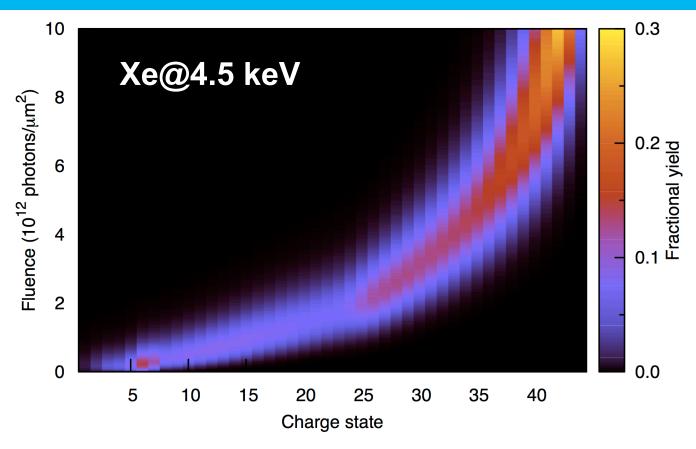

Photosystem I: 3D Visualization of diffraction patterns using serial femtosecond crystallography (left) and electron density map obtained from these diffraction data (top)

Chapman *et al.*, *Nature* **470**, 73 (2011). Image courtesy: <u>Thomas White, CFEL</u>

High X-ray intensity

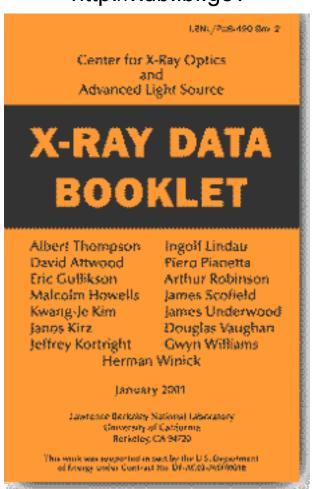

- > Here we will discuss only one-photon absorption limit.
- Later you will see more interesting physics with intense x-ray pulses.

PHD TUTORIAL

Concepts in x-ray physics

Robin Santra

Argonne National Laboratory, Argonne, IL 60439, USA

Department of Physics, University of Chicago, Chicago, IL 60637, USA

Received 26 November 2008 Published 29 December 2008 Online at stacks.iop.org/JPhysB/42/023001

A basic introduction to the theory underlying x-ray processes is provided. After general remarks on the practical advantages of using x-rays for probing matter, the derivation of the minimal-coupling Hamiltonian within nonrelativistic quantum electrodynamics is outlined. Perturbation theory is reviewed and applied to describe x-ray-induced processes. In connection with x-ray absorption, inner-shell binding energies and the photon energy dependence of the x-ray absorption cross section are discussed. In the context of x-ray scattering, atomic and molecular scattering factors are introduced, the complex index of refraction is derived, and the nonrelativistic theory of Compton scattering is described. The final topic is x-ray fluorescence and Auger decay of inner-shell-excited systems.

1. Introductory remarks

Röntgen [1], x-rays have become an indispensable tool for studying the structure and electronic properties of matter. Equally important is the role x-rays have come to play in applications. To date, 19 Nobel prizes have been awarded for x-ray-related research (W C Röntgen 1901, M von Laue combination with perturbation theory (section 3), allows one K M G Siegbahn 1924, A H Compton 1927, P J W Debye 1936, H J Muller 1946, M F Perutz and J C Kendrew 1962, FHCCrick, JD Watson, and MHF Wilkins 1962, D Crowfoot Hodgkin 1964, W N Lipscomb 1976, A M Cormack and G N Hounsfield 1979, K M Siegbahn 1981, H A Hauptman P D Boyer and J E Walker 1997, P Agre and R MacKinnon 2003, R Komberg 2006).

As a new generation of x-ray sources-so-called x-ray free-electron lasers [2, 3]-is about to come online [4-6], it is timely to familiarize newcomers, experimentalists and theorists alike, with some of the basic properties that make x-rays such a powerful tool. This is attempted in this tutorial. The emphasis is on the development of a consistent theoretical processes. Throughout, the x-rays are assumed to be used as the 1s binding energies for elements ranging from carbon

a weak, essentially nonperturbative probe. Basic applications of x-rays will be covered. However, since this is a tutorial Since their discovery in the year 1895 by Wilhelm Conrad there is not a single topic that is discussed in great depth, and some topics, e.g., x-ray sources and x-ray optics [7, 8], are not

This tutorial is structured as follows. In section 2, medicine, archaeology, art, security, astronomy and other the derivation of the Hamiltonian underlying nonrelativistic quantum electrodynamics is sketched. This Hamiltonian, in 1914, W H Bragg and W L Bragg 1915, C G Barkla 1917, to describe all basic x-ray processes. X-ray absorption is the topic of section 4. In section 5, x-ray scattering processes are discussed. Finally, in section 6, relaxation processes following the excitation of an inner-shell electron are treated.

Atomic units are employed, i.e., $m_e = 1$, |e| = 1, $\hbar = 1$ and $c = 1/\alpha$, where m_e is the electron mass, e is the and J Karle 1985, J Deisenhofer, R Huber and H Michel 1988, electron charge, \hbar is Planck's constant divided by 2π , c is the speed of light in vacuum and $\alpha = \frac{e^2}{\hbar c} \approx 1/137$ is the fine-structure constant. The atomic unit of length is the bohr, $a_0 = \frac{1}{a} \frac{\hbar}{m_e c} \approx 0.529$ Å. The atomic unit of cross section is $a_0^2 \approx 28.0$ Mb, where a barn (b) equals 10^{-28} m². The atomic unit of energy is the hartree, $E_h = m_e c^2 \alpha^2 \approx 27.2 \text{ eV}.$

Depending on the photon energy, we typically distinguish between the following two x-ray regimes [7, 8]. Photons with an energy between $\sim 10~E_h~(\sim 300~\text{eV})$ and $\sim 100~E_h$ framework that may be employed to describe a variety of x-ray (a few keV) are called soft x-rays. Soft x-rays cover, roughly,

How to treat interaction between X-ray and matter?

Total Hamiltonian

$$\hat{H} = \hat{H}_{\text{mol}} + \hat{H}_{\text{EM}} + \hat{H}_{\text{int}}$$

- > X-rays interact with the electrons only
- > Non-relativistic quantum electrodynamics
- Principle of Minimal Coupling
- Time-dependent perturbation theory

Atomic units used:

$$m_e = 1$$
 $|e| = 1$
 $\hbar = 1$
 $1/4\pi\epsilon_0 = 1$
 $(c = 1/\alpha, a_0 = 1)$

Hamiltonian for free electromagnetic field

Hamiltonian for the free electromagnetic field (harmonic oscillator)

$$\hat{H}_{EM} = \sum_{\mathbf{k},\lambda} \omega_{\mathbf{k}} \hat{a}_{\mathbf{k},\lambda}^{\dagger} \hat{a}_{\mathbf{k},\lambda}, \ \omega_{\mathbf{k}} = |\mathbf{k}|/\alpha$$

Photon mode: wave vector \pmb{k} and polarization vector $\pmb{\epsilon}_{\pmb{k},\lambda} = \begin{pmatrix} \pmb{k} \cdot \pmb{\epsilon}_{\pmb{k},\lambda} = 0, \\ \pmb{\epsilon}_{\pmb{k},1}^* \cdot \pmb{\epsilon}_{\pmb{k},2} = 0 \end{pmatrix}$

Field operator: annihilates or creates a photon in the mode (k,λ).

$$\hat{a}_{\mathbf{k},\lambda}|n_{\mathbf{k},\lambda}\rangle = \sqrt{n_{\mathbf{k},\lambda}}|n_{\mathbf{k},\lambda} - 1\rangle$$

$$\hat{a}_{\mathbf{k},\lambda}^{\dagger}|n_{\mathbf{k},\lambda}\rangle = \sqrt{n_{\mathbf{k},\lambda} + 1}|n_{\mathbf{k},\lambda} + 1\rangle$$

Commutator relations for photon mode operators

$$[a,b] = ab - ba$$

$$[\hat{a}_{\mathbf{k},\lambda}, \hat{a}_{\mathbf{k}',\lambda'}] = 0$$

$$[\hat{a}_{\mathbf{k},\lambda}, \hat{a}_{\mathbf{k}',\lambda'}^{\dagger}] = \delta_{\mathbf{k},\mathbf{k}'} \delta_{\lambda,\lambda'}$$

$$[\hat{a}_{\mathbf{k},\lambda}^{\dagger}, \hat{a}_{\mathbf{k}',\lambda'}^{\dagger}] = 0$$

Molecular Hamiltonian

Molecular Hamiltonian

$$\hat{H}_{\text{mol}} = \hat{T}_{\text{N}} + \hat{V}_{\text{NN}} + \hat{H}_{\text{el}}$$

$$\hat{T}_{\mathrm{N}} = -\sum_{a} \frac{\nabla_a^2}{2M_a}$$
 $\hat{V}_{\mathrm{NN}} = \sum_{a < a'} \frac{Z_a Z_{a'}}{|\mathbf{R}_a - \mathbf{R}_{a'}|}$

Electronic Hamiltonian using the second quantization

$$\hat{H}_{el} = \int d^3x \, \hat{\psi}^{\dagger}(\boldsymbol{x}) \left\{ -\frac{\nabla^2}{2} - \sum_{a} \frac{Z_a}{|\boldsymbol{x} - \boldsymbol{R}_a|} \right\} \hat{\psi}(\boldsymbol{x}) + \frac{1}{2} \int d^3x \, \int d^3x' \, \hat{\psi}^{\dagger}(\boldsymbol{x}) \hat{\psi}^{\dagger}(\boldsymbol{x}') \frac{1}{|\boldsymbol{x} - \boldsymbol{x}'|} \hat{\psi}(\boldsymbol{x}') \hat{\psi}(\boldsymbol{x})$$

Anticommutator relations for electron field operators

$$\{a,b\} = ab + ba$$

$$\{\hat{\psi}_{\sigma}(\boldsymbol{x}), \hat{\psi}_{\sigma'}(\boldsymbol{x}')\} = 0,$$

$$\{\hat{\psi}_{\sigma}(\boldsymbol{x}), \hat{\psi}_{\sigma'}(\boldsymbol{x}')\} = \delta, \quad \delta^{(3)}(\boldsymbol{x})$$

$$\{\hat{\psi}_{\sigma}(\boldsymbol{x}), \hat{\psi}_{\sigma'}^{\dagger}(\boldsymbol{x}')\} = \delta_{\sigma,\sigma'}\delta^{(3)}(\boldsymbol{x} - \boldsymbol{x}'),$$

$$\{\hat{\psi}_{\sigma}^{\dagger}(\boldsymbol{x}), \hat{\psi}_{\sigma'}^{\dagger}(\boldsymbol{x}')\} = 0.$$

Interaction Hamiltonian

Interaction between electrons and photons (minimal coupling, Coulomb gauge)

p•A and A²

$$\hat{H}_{\text{int}} = \alpha \int d^3 x \, \hat{\psi}^{\dagger}(\boldsymbol{x}) \left[\hat{\mathbf{A}}(\boldsymbol{x}) \cdot \frac{\boldsymbol{\nabla}}{i} \right] \hat{\psi}(\boldsymbol{x}) + \frac{\alpha^2}{2} \int d^3 x \, \hat{\psi}^{\dagger}(\boldsymbol{x}) \hat{A}^2(\boldsymbol{x}) \hat{\psi}(\boldsymbol{x})$$

Mode expansion of vector potential

$$\hat{\mathbf{A}}(\boldsymbol{x}) = \sum_{\boldsymbol{k},\lambda} \sqrt{\frac{2\pi}{V\omega_{\boldsymbol{k}}\alpha^2}} \left\{ \hat{a}_{\boldsymbol{k},\lambda} \boldsymbol{\epsilon}_{\boldsymbol{k},\lambda} e^{\mathrm{i}\boldsymbol{k}\cdot\boldsymbol{x}} + \hat{a}_{\boldsymbol{k},\lambda}^{\dagger} \boldsymbol{\epsilon}_{\boldsymbol{k},\lambda}^* e^{-\mathrm{i}\boldsymbol{k}\cdot\boldsymbol{x}} \right\}$$

p•A: one-photon absorption in first order; one-photon scattering in second order **A**²: one-photon scattering in first order

Time-dependent perturbation theory

Full Hamiltonian and unperturbed part
$$\hat{H} = \underbrace{\hat{H}_{
m mol} + \hat{H}_{
m EM}}_{\hat{H}_0} + \hat{H}_{
m int}$$

Initial state: $|I
angle = |\Psi_0^{N_{
m el}}
angle |N_{
m EM}
angle$

Interaction-picture state vector to second order in perturbation

$$|\Psi, t\rangle_{\text{int}} = |I\rangle - i \int_{-\infty}^{t} dt' \, e^{i\hat{H}_{0}t'} \hat{H}_{\text{int}} e^{-\epsilon|t'|} e^{-i\hat{H}_{0}t'} |I\rangle$$

$$- \int_{-\infty}^{t} dt' \, e^{i\hat{H}_{0}t'} \hat{H}_{\text{int}} e^{-\epsilon|t'|} e^{-i\hat{H}_{0}t'} \int_{-\infty}^{t'} dt'' \, e^{i\hat{H}_{0}t''} \hat{H}_{\text{int}} e^{-\epsilon|t''|} e^{-i\hat{H}_{0}t''} |I\rangle + \cdots$$

Transition rate to second order in perturbation

$$\Gamma_{FI} = 2\pi\delta(E_F - E_I) \left| \langle F|\hat{H}_{\rm int}|I\rangle + \sum_{M} \frac{\langle F|\hat{H}_{\rm int}|M\rangle\langle M|\hat{H}_{\rm int}|I\rangle}{E_I - E_M - i\epsilon} + \cdots \right|^2$$

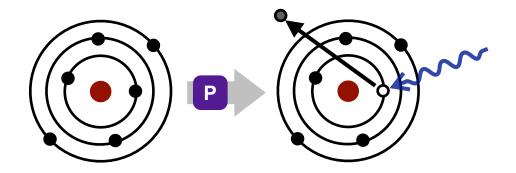

X-ray absorption

X-ray absorption

Initial state: $|I
angle = |\Psi_0^{N_{
m el}}
angle |N_{
m EM}
angle$

Final state: $|F
angle = |\Psi_F^{N_{
m el}}
angle |N_{
m EM}-1
angle$

Absorption rate: $\Gamma_{FI}=2\pi\delta(E_F-E_I)\left|\langle F|\hat{H}_{\rm int}|I\rangle\right|^2$

X-ray absorption cross section

X-ray absorption rate

$$\Gamma_{FI} = \frac{4\pi^2}{\omega_{\text{in}}} \frac{N_{\text{EM}}}{V} \delta \left(E_F^{N_{\text{el}}} - E_0^{N_{\text{el}}} - \omega_{\text{in}} \right)$$

$$\times \left| \langle \Psi_F^{N_{\text{el}}} | \int d^3 x \, \hat{\psi}^{\dagger}(\boldsymbol{x}) e^{i\boldsymbol{k}_{\text{in}} \cdot \boldsymbol{x}} \boldsymbol{\epsilon}_{\boldsymbol{k}_{\text{in}}, \lambda_{\text{in}}} \cdot \frac{\boldsymbol{\nabla}}{i} \hat{\psi}(\boldsymbol{x}) | \Psi_0^{N_{\text{el}}} \rangle \right|^2$$

X-ray photon flux

$$J_{\rm EM} = \frac{1}{\alpha} \frac{N_{\rm EM}}{V}$$

X-ray absorption cross section

$$\sigma = \Gamma_{FI}/J_{\rm EM}$$

$$\sigma_{F}(\mathbf{k}_{\mathrm{in}}, \lambda_{\mathrm{in}}) = \frac{4\pi^{2}}{\omega_{\mathrm{in}}} \alpha \delta \left(E_{F}^{N_{\mathrm{el}}} - E_{0}^{N_{\mathrm{el}}} - \omega_{\mathrm{in}} \right)$$

$$\times \left| \langle \underline{\Psi_{F}^{N_{\mathrm{el}}}} | \int d^{3}x \, \hat{\psi}^{\dagger}(\mathbf{x}) e^{i\mathbf{k}_{\mathrm{in}} \cdot \mathbf{x}} \boldsymbol{\epsilon}_{\mathbf{k}_{\mathrm{in}}, \lambda_{\mathrm{in}}} \cdot \frac{\nabla}{i} \hat{\psi}(\mathbf{x}) | \underline{\Psi_{0}^{N_{\mathrm{el}}}} \rangle \right|^{2}$$

how to treat many-electron systems?

Electronic many-body problem

Introducing a set of orthonormal spin orbitals $\{ arphi_p(m{x}) \}$

which are eigenstates of an one-body Hamiltonian $~\hat{F}|\varphi_p\rangle=\varepsilon_p|\varphi_p\rangle$

An electronic one-body Hamiltonian

$$\hat{F} = \sum_{p} \varepsilon_{p} \hat{c}_{p}^{\dagger} \hat{c}_{p}$$

Creation and annihilation operators for $|\phi_p\rangle$: \hat{c}_p^\dagger and \hat{c}_p

$$\{\hat{c}_p, \hat{c}_q\} = 0,$$

$$\{\hat{c}_p, \hat{c}_q^{\dagger}\} = \delta_{p,q},$$

$$\{\hat{c}_p^{\dagger}, \hat{c}_q^{\dagger}\} = 0.$$

Connecting with the field operators

$$\hat{\psi}(\boldsymbol{x}) = \sum_{p} \varphi_{p}(\boldsymbol{x}) \hat{c}_{p},$$

$$\hat{\psi}^{\dagger}(\boldsymbol{x}) = \sum_{p} \varphi_{p}^{\dagger}(\boldsymbol{x}) \hat{c}_{p}^{\dagger}$$

Mean-field model

Independent-electron model:

$$\hat{H}_{\rm el} \approx \hat{F}$$

Mean-field ground state in terms of a single Slater determinant:

$$\left|\Psi_{0}^{N_{\mathrm{el}}}\right\rangle \approx \left|\Phi_{0}^{N_{\mathrm{el}}}\right\rangle \equiv \prod_{i=1}^{N_{\mathrm{el}}} \hat{c}_{i}^{\dagger} \left| \text{vacuum}\right\rangle$$

Mean-field ground-state energy:

$$E_0^{N_{\rm el}} \equiv \left\langle \Psi_0^{N_{\rm el}} \left| \hat{H}_{\rm el} \right| \Psi_0^{N_{\rm el}} \right\rangle \approx \left\langle \Phi_0^{N_{\rm el}} \left| \hat{F} \right| \Phi_0^{N_{\rm el}} \right\rangle = \sum_{i=1}^{N_{\rm el}} \varepsilon_i$$

Hartree-Fock (HF) method: minimizing $\left\langle \Phi_0^{N_{\rm el}} \left| \hat{H}_{\rm el} - \hat{F} \right| \Phi_0^{N_{\rm el}} \right\rangle$ the best choice among the mean-field models

Koopmans' theorem

One-hole state

$$|\Phi_i^{N_{\rm el}-1}\rangle \equiv \hat{c}_i |\Phi_0^{N_{\rm el}}\rangle$$

Energy of one-hole state

$$E_i^{N_{\rm el}-1} \approx \langle \Phi_i^{N_{\rm el}-1} | \hat{F} | \Phi_i^{N_{\rm el}-1} \rangle = \left\{ \sum_{j=1}^{N_{\rm el}} \varepsilon_j \right\} - \varepsilon_i$$

Ionization potential

$$I_i \equiv E_i^{N_{\rm el}-1} - E_0^{N_{\rm el}} \approx -\varepsilon_i$$

Koopmans' theorem: valid for the HF solution

$$\begin{split} I_i = & \langle \Phi_i^{\mathrm{HF}, N_{\mathrm{el}} - 1} | \hat{H}_{\mathrm{el}} | \Phi_i^{\mathrm{HF}, N_{\mathrm{el}} - 1} \rangle \\ & - \langle \Phi_0^{\mathrm{HF}, N_{\mathrm{el}}} | \hat{H}_{\mathrm{el}} | \Phi_0^{\mathrm{HF}, N_{\mathrm{el}}} \rangle = -\varepsilon_i \end{split}$$

Note: Koopmans received a Nobel prize in Economics in 1975, of course, not for this theorem.

For Neon,	
Koopmans	EXP
$-\varepsilon_{2p} = 23.1 \text{ eV}$	21.6 eV
$-\varepsilon_{2s} = 52.5 \text{ eV}$	48.5 eV
$-\varepsilon_{1s} = 892 \text{ eV}$	870 eV

X-ray absorption within mean-field model

Particle-hole state $|\Phi_i^a
angle \equiv \hat{c}_a^\dagger |\Phi_i^{N_{
m el}-1}
angle = \hat{c}_a^\dagger \hat{c}_i |\Phi_0^{N_{
m el}}
angle$

Initial state
$$|I
angle = |\Phi_0^{N_{
m el}}
angle |N_{
m EM}
angle$$

Final state
$$|F
angle=\hat{c}_a^\dagger\hat{c}_i\,|\Phi_0^{N_{\mathrm{el}}}
angle|N_{\mathrm{EM}}-1
angle$$

Cross section for particle-hole transition

$$\sigma_i^a(\mathbf{k}_{\rm in}, \lambda_{\rm in}) = \frac{4\pi^2}{\omega_{\rm in}} \alpha \delta(\varepsilon_a + I_i - \omega_{\rm in}) \left| \langle \varphi_a | e^{i\mathbf{k}_{\rm in} \cdot \mathbf{x}} \boldsymbol{\epsilon}_{\mathbf{k}_{\rm in}, \lambda_{\rm in}} \cdot \frac{\boldsymbol{\nabla}}{i} | \varphi_i \rangle \right|^2$$

Subshell x-ray absorption cross section

$$\sigma_i(\mathbf{k}_{\mathrm{in}}, \lambda_{\mathrm{in}}) = \sum_{\hat{a}} \sigma_i^a(\mathbf{k}_{\mathrm{in}}, \lambda_{\mathrm{in}})$$

Energy of excited electron

$$\varepsilon_a = \omega_{\rm in} - I_i > 0$$
 "Photoelectric effect"

Note: Einstein received a Nobel prize in 1921 for the photoelectric effect, not for theory of relativity.

X-ray absorption cross section

> After employing the dipole approximation and atomic orbitals, X-ray absorption cross section of its orbital at ω is calculated as

$$\sigma_P(i,\omega) = \frac{4}{3}\alpha\pi^2\omega N_i \sum_{l_j=|l_i-1|}^{l_j+1} \frac{l_j}{2l_i+1} \left| \int_0^\infty \frac{u_{n_i l_i}(r)u_{\varepsilon l_j}(r)rdr}{u_{n_i l_i}(r)u_{\varepsilon l_j}(r)rdr} \right|^2$$
 bound-state orbital continuum-state orbital

Fig. 1-1. Transitions that give rise to the emission lines in Table 1-3.

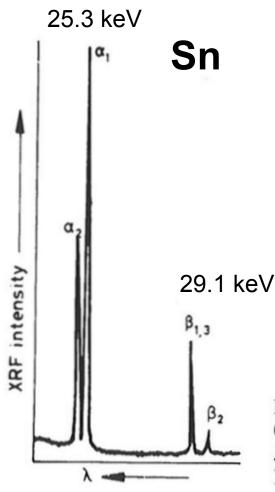

X-ray fluorescence transition lines (cont.)

XRF: X-Ray Fluorescence

Transition lines

 $K\alpha_1: K_1 - L_3, 1s - 2p_{3/2}$

 $K\alpha_2: K_1 - L_2, 1s - 2p_{1/2}$

 $K\beta_1: K_1 - M_2, 1s - 3p_{1/2}$

 $K\beta_2: K_1 - N_{2,3}, 1s - 4p_{1/2,3/2}$

 $K\beta_3$: $K_1 - M_3$, $1s - 3p_{3/2}$

position: transition energy

intensity: transition rate

Figure 8.30 K emission spectrum of tin. The α_1 and β_2 lines are at 0.491 and 0.426 Å, respectively. (Reproduced, with permission, from Jenkins, R., An Introduction to X-ray Spectrometry, p. 22, Heyden, London, 1976)

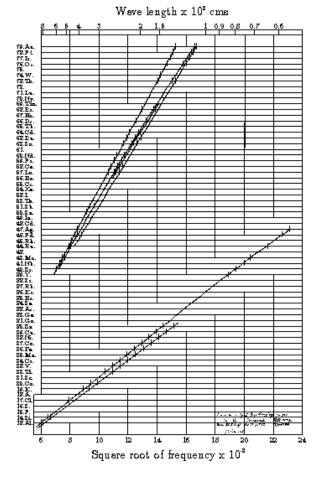

Kα fluorescence: a simple model

- > Simple model of an atomic species of atomic number Z
 - 1s orbital ~ H-like 1s orbital of Z
 - 2p orbital ~ H-like 2p orbital of Z
- > Ka photon energy: $\omega_{K\alpha} \sim Z^2$
- > K α fluorescence rate: $\Gamma_{K\alpha} \sim Z^4$

Moseley's law $\sqrt{\omega} \propto Z$ Phil. Mag. 27, 702 (1914).

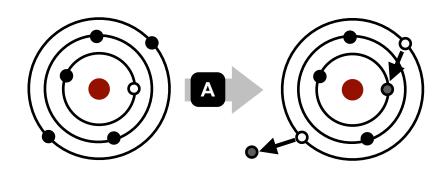

Auger-Meitner within mean-field model

A renaming proposal to Auger-Meitner: Physics Today 72, 10 (2019).

Initial state: $|I
angle = \hat{c}_i |\Phi_0^{N_{
m el}}
angle$

Final state: $|F\rangle=\hat{c}_a^{\dagger}\hat{c}_j\hat{c}_{j'}|\Phi_0^{N_{\rm el}}\rangle, \quad j,j'\neq i$

Auger rate: $\Gamma_{FI} = 2\pi\delta(E_F-E_I)\left|\langle F|\hat{H}_{\mathrm{int}}|I
angle\right|^2$

Auger-Meitner rate and energy

$$\text{Perturbation theory } \hat{H}_0 = \hat{F}, \, \hat{H}_{\text{int}} = \frac{1}{2} \sum_{pqrs} v_{pqrs} \hat{c}_p^\dagger \hat{c}_q^\dagger \hat{c}_s \hat{c}_r - \sum_{pq} \sum_i \left\{ v_{piqi} - v_{piiq} \right\} \hat{c}_p^\dagger \hat{c}_q$$

Coulomb matrix element
$$v_{pqrs} = \int \mathrm{d}^3x \int \mathrm{d}^3x' \varphi_p^\dagger(\boldsymbol{x}) \varphi_q^\dagger(\boldsymbol{x}') \frac{1}{|\boldsymbol{x} - \boldsymbol{x}'|} \varphi_r(\boldsymbol{x}) \varphi_s(\boldsymbol{x}')$$

Partial Auger-Meitner rate

$$\Gamma_{i,jj'} = 2\pi \sum_{a} |v_{aijj'} - v_{aij'j}|^2 \delta(\varepsilon_a + I_j + I_{j'} - I_i)$$

Auger-Meitner electron energy $\varepsilon_a =$

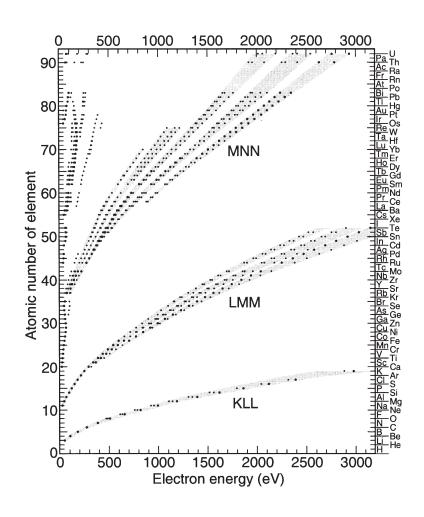

$$\varepsilon_a = I_i - I_j - I_{j'}$$

KLL Auger-Meitner decay: a simple model

- Simple model of an atomic species of atomic number Z
 - 1s orbital ~ H-like 1s orbital of Z
 - 2p orbital ~ H-like 2p orbital of Z
 - Auger electron wave function ~
 plane wave
- Focus on the channel with two 2p holes in the final state: KLL
- > KLL Auger electron E: $\varepsilon_{KLL} \sim Z^2$
- > KLL Auger decay rate: $\Gamma_{KLL} \sim Z^0$

AES: Auger-Meitner Electron Spectrum

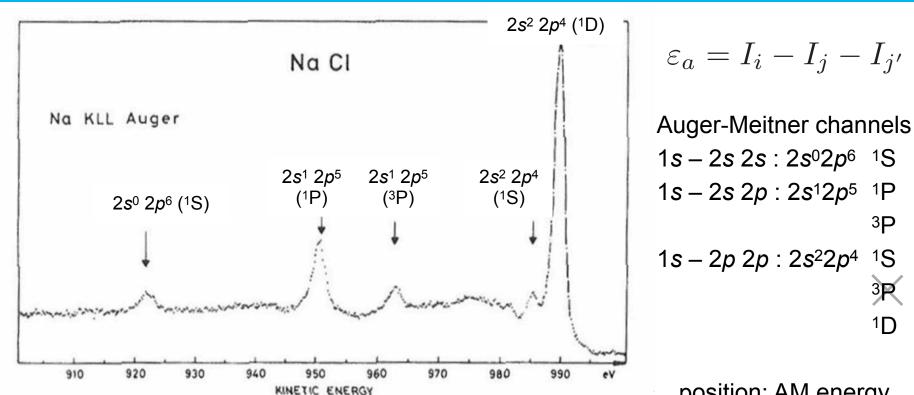

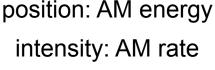

Figure 8.26 The $KL_{II,III}L_{II,III}$ (1D_2 and 1S_0) Auger spectrum of sodium in solid NaCl. (Reproduced, with permission, from Siegbahn, K. (June 1976), *Publication No. UUIP-940*, p. 81, Uppsala University Institute of Physics)

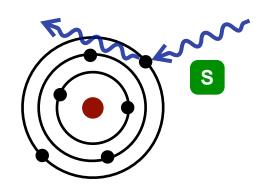

X-ray scattering

Elastic X-ray scattering

Initial state: $|I
angle = |\Psi_0^{N_{
m el}}
angle |N_{
m EM}
angle$

Final state: $|F\rangle=|\Psi_0^{N_{\rm el}}\rangle\hat{a}_{{m k}_F,\lambda_F}^{\dagger}|N_{\rm EM}-1\rangle$

Scattering rate: $\Gamma_{FI} = 2\pi\delta(E_F - E_I) \left| \langle F|\hat{H}_{\rm int}|I\rangle \right|^2$

Elastic X-ray scattering form factor

Transition rate

$$\Gamma_{FI} = \frac{(2\pi)^3}{V} \frac{N_{\rm EM}}{V} \frac{1}{\omega_F \omega_{\rm in}} \left| \boldsymbol{\epsilon}_{\boldsymbol{k}_F, \lambda_F}^* \cdot \boldsymbol{\epsilon}_{\boldsymbol{k}_{\rm in}, \lambda_{\rm in}} \right|^2 \left| f^0(\boldsymbol{k}_{\rm in} - \boldsymbol{k}_F) \right|^2 \delta(\omega_F - \omega_{\rm in})$$

Scattering vector (or momentum transfer)

$$oldsymbol{Q} = oldsymbol{k}_{ ext{in}} - oldsymbol{k}_F$$

Scattering (or form) factor

$$f^{0}(\mathbf{Q}) = \int d^{3}x \, \rho^{(el)}(\mathbf{x}) e^{i\mathbf{Q}\cdot\mathbf{x}}$$

Electron density

$$ho^{(\mathrm{el})}(oldsymbol{x}) = \langle \Psi_0^{N_{\mathrm{el}}} | \hat{\psi}^\dagger(oldsymbol{x}) \hat{\psi}(oldsymbol{x}) | \Psi_0^{N_{\mathrm{el}}}
angle$$

Elastic x-ray scattering cross section

Differential cross section

$$d\sigma = \sum_{\mathbf{k}_F, \lambda_F} \frac{\Gamma_{FI}}{J_{\text{EM}}} = \frac{V}{(2\pi)^3} \alpha^3 d\Omega \sum_{\lambda_F} \int_0^\infty d\omega_F \, \omega_F^2 \frac{\Gamma_{FI}}{J_{\text{EM}}}$$
$$\frac{d\sigma(\mathbf{Q})}{d\Omega} = \alpha^4 \left| f^0(\mathbf{Q}) \right|^2 \sum_{\lambda_F} \left| \boldsymbol{\epsilon}_{\mathbf{k}_F, \lambda_F}^* \cdot \boldsymbol{\epsilon}_{\mathbf{k}_{\text{in}}, \lambda_{\text{in}}} \right|^2 = \left(\frac{d\sigma}{d\Omega} \right)_T \left| f^0(\mathbf{Q}) \right|^2$$

Total form factor decomposed in terms of atomic contributions

$$f^{0}(\mathbf{Q}) \approx \int d^{3}x \sum_{n} \rho_{n}^{(\text{el})}(\mathbf{x} - \mathbf{R}_{n}) e^{i\mathbf{Q} \cdot \mathbf{x}}$$

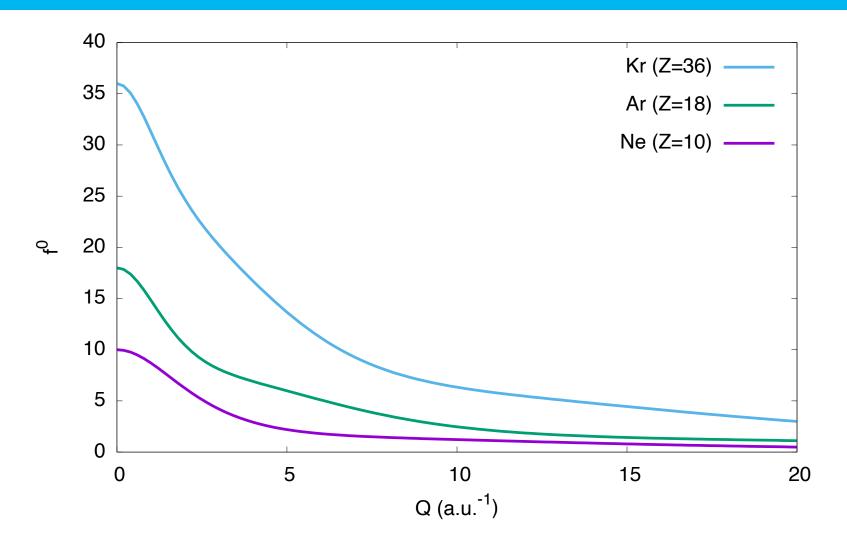

$$= \sum_{n} \left\{ \int d^{3}x' \rho_{n}^{(\text{el})}(\mathbf{x}') e^{i\mathbf{Q} \cdot \mathbf{x}'} \right\} e^{i\mathbf{Q} \cdot \mathbf{R}_{n}}$$

$$\equiv \sum_{n} f_{n}^{0}(\mathbf{Q}) e^{i\mathbf{Q} \cdot \mathbf{R}_{n}}$$

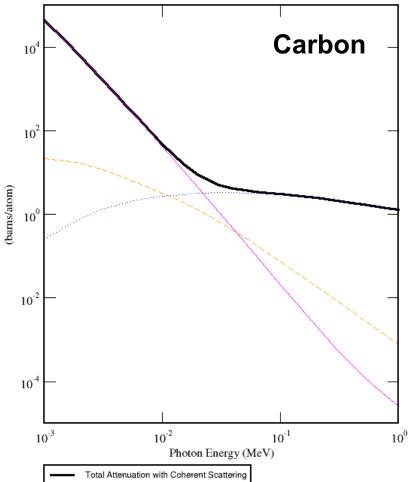

Atomic form factor

Absorption vs. scattering

C@10 keV

σ_{absorption}=41 barn

σ_{el. scattering}=3.2 barn

σ_{inel. scattering}=2.7 barn

$$\frac{\sigma_{\rm el.~sc}}{\sigma_{\rm abs}} \sim \frac{1}{13}$$

Coherent Scattering

Incoherent Scattering Photoelectric Absorption

Dispersive correction to elastic X-ray scattering

Resonant elastic x-ray scattering:
When the photon energy approaches to the ionization potential, the second order of p•A becomes important.

Elastic X-ray scattering tensor: second-order correction with p•A

$$f_{i,j}(\boldsymbol{Q}, \boldsymbol{k}_{\text{in}}) = f^{0}(\boldsymbol{Q})\delta_{i,j}$$

$$+ \sum_{r} \langle \Psi_{0}^{N_{\text{el}}} | \int d^{3}x \hat{\psi}^{\dagger}(\boldsymbol{x}) e^{-i\boldsymbol{k}_{F}\cdot\boldsymbol{x}} \frac{(\boldsymbol{\nabla})_{i}}{i} \hat{\psi}(\boldsymbol{x}) | \Psi_{r}^{N_{\text{el}}} \rangle$$

$$\times \frac{1}{E_{0}^{N_{\text{el}}} + \omega_{\text{in}} - E_{r}^{N_{\text{el}}} + i\epsilon}$$

$$\times \langle \Psi_{r}^{N_{\text{el}}} | \int d^{3}x \hat{\psi}^{\dagger}(\boldsymbol{x}) e^{i\boldsymbol{k}_{\text{in}}\cdot\boldsymbol{x}} \frac{(\boldsymbol{\nabla})_{j}}{i} \hat{\psi}(\boldsymbol{x}) | \Psi_{0}^{N_{\text{el}}} \rangle.$$

Dispersive correction to elastic X-ray scattering

Elastic X-ray scattering in the forward direction

Scalar scattering factor
$$f(\omega_{\rm in}, \boldsymbol{\epsilon}_{\rm in}) = f^0(\mathbf{0}) + f'(\omega_{\rm in}, \boldsymbol{\epsilon}_{\rm in}) + \mathrm{i} f''(\omega_{\rm in}, \boldsymbol{\epsilon}_{\rm in})$$

Total number of electrons

$$f^0(\mathbf{0}) = N_{\rm el}$$

Relationship between imaginary part of scattering factor and absorption cross section

$$f''(\omega_{\rm in}, \epsilon_{\rm in}) = -\frac{\omega_{\rm in}}{4\pi\alpha} \sum_F \sigma_F(\omega_{\rm in}, \epsilon_{\rm in})$$

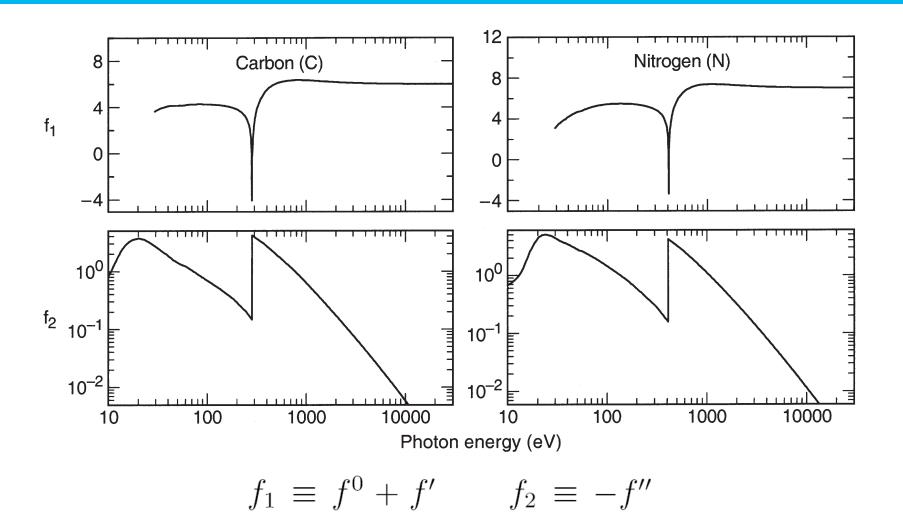

Kramers-Kronig relation

$$f'(\omega_{\rm in}, \boldsymbol{\epsilon}_{\rm in}) = \frac{1}{\pi} \Pr \int_{-\infty}^{\infty} d\omega'_{\rm in} \frac{f''(\omega'_{\rm in}, \boldsymbol{\epsilon}_{\rm in})}{\omega'_{\rm in} - \omega_{\rm in}}$$

Dispersive correction (anomalous scattering)

X-ray scattering

elastic vs. inelastic

$$|\Psi_I^{
m el}
angle = |\Psi_F^{
m el}
angle \hspace{0.5cm} |\Psi_I^{
m el}
angle
eq |\Psi_F^{
m el}
angle$$

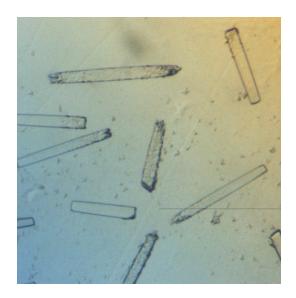

without M vs. with M (A²) (p•A)

- Elastic X-ray scattering
 - Non-resonant elastic X-ray scattering via A²
 - Resonant elastic X-ray scattering via p•A (Dispersion correction)
- Inelastic X-ray scattering
 - Non-resonant inelastic X-ray scattering via A² (Compton scattering)
 - Resonant inelastic X-ray scattering via p•A (RIXS or resonant X-ray Raman)

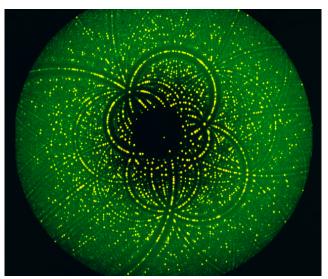

X-ray crystallography

Protein crystal

X-ray diffraction pattern

$$I \sim \left| f^0(\boldsymbol{Q}) \right|^2$$

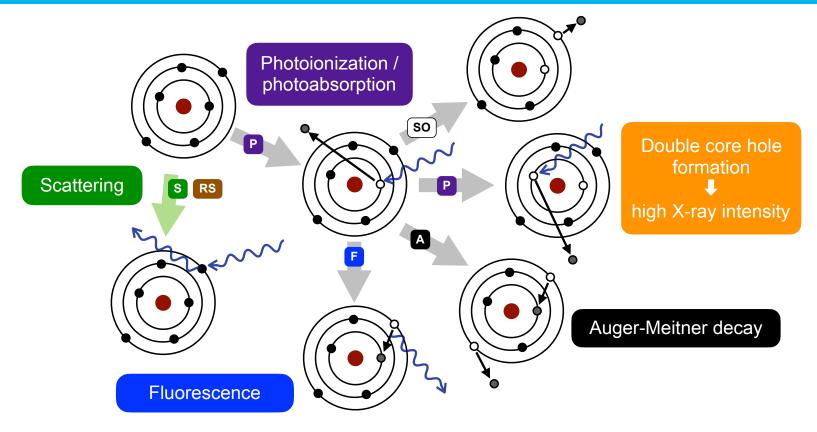

Molecular structure of a protein

$$f^0(\boldsymbol{Q}) \stackrel{\mathrm{IFT}}{\underset{\mathrm{FT}}{\rightleftharpoons}} \rho^{(\mathrm{el})}(\boldsymbol{x})$$

Summary

- Theoretical aspects of X-ray-induced processes
- Many-electron system: mean-field approach
- σ and Γ calculated within the same framework (QED and TDPT)
