# Phase0, $\xi=4$

Efficiency, fake rate, generated tracks vs. true particle energy, Bayesian error bars

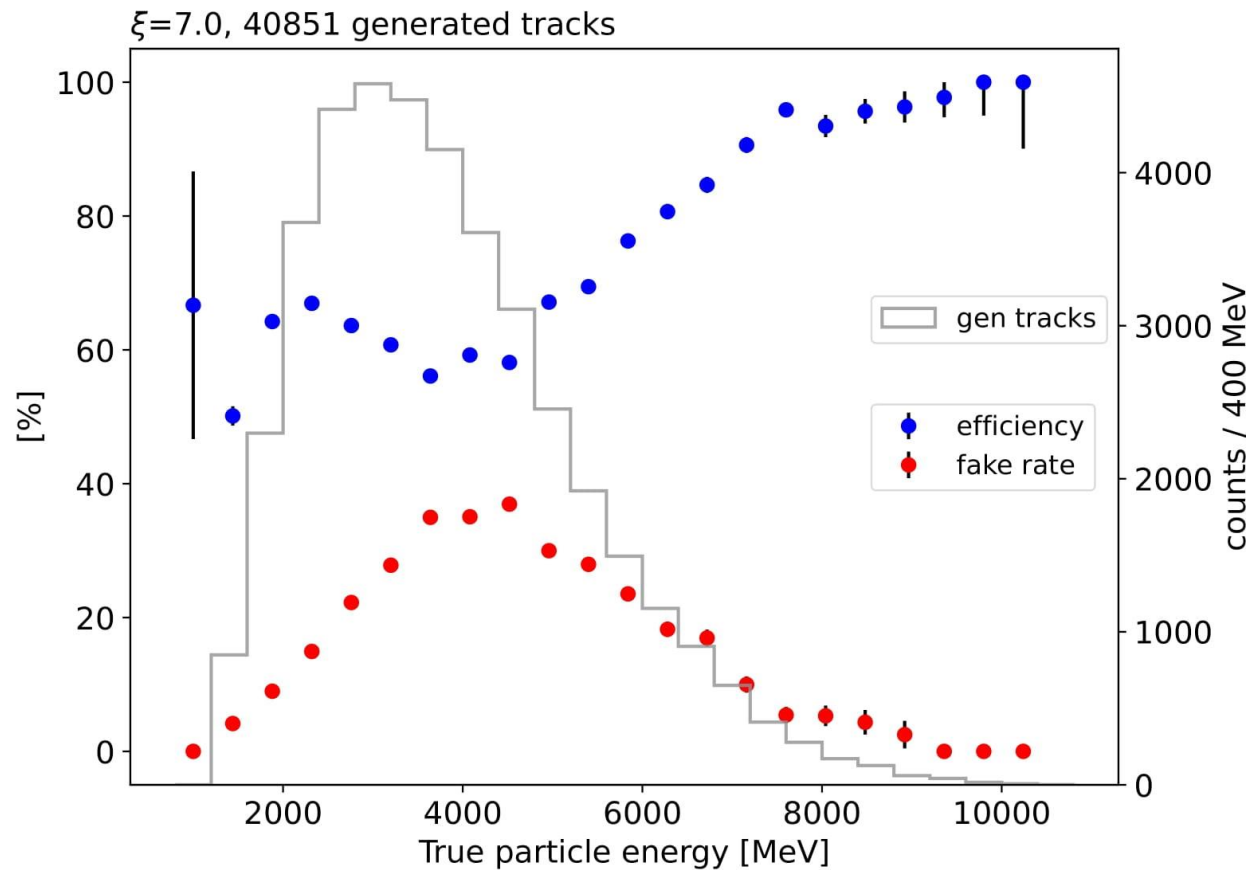

# Phase0, $\xi=5$

Efficiency, fake rate, generated tracks vs. true particle energy, Bayesian error bars

# Phase0, $\xi=7$

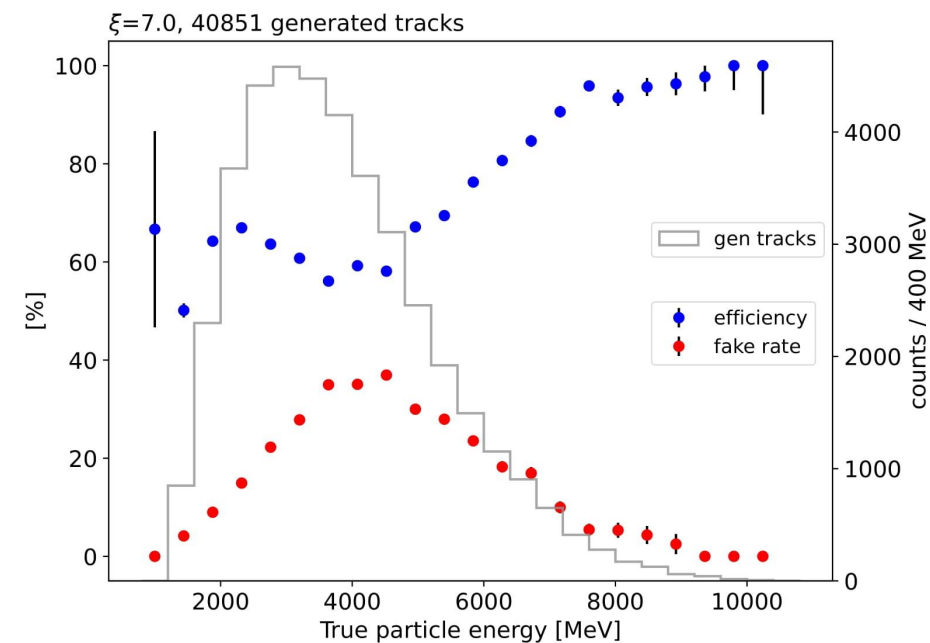

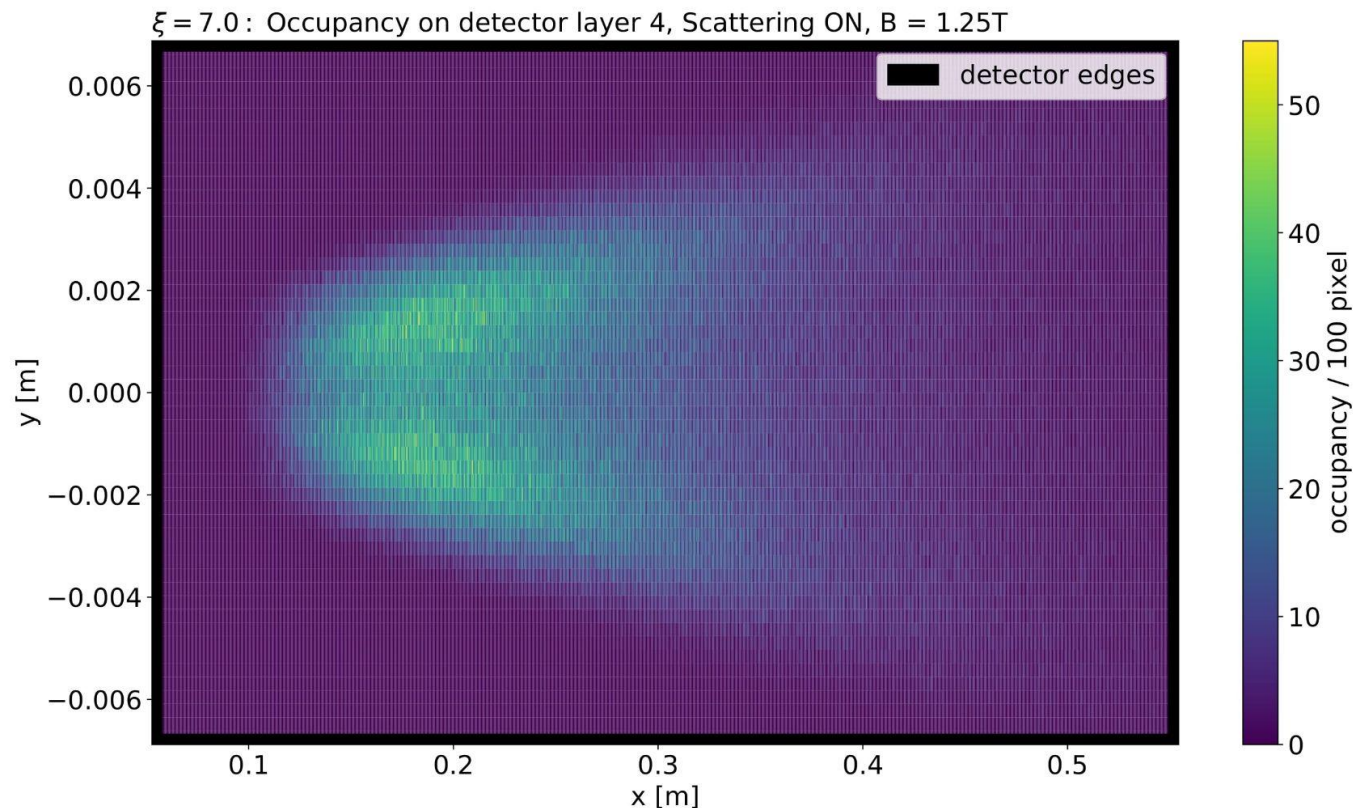

Efficiency, fake rate, generated tracks vs. true particle energy, Bayesian error bars

- good efficiency for  $\xi = 4, 5$  and low fake rate
- efficiency drop at high density areas for  $\xi = 7$
- not exactly matching of most occupied bin and lowest efficiency  $\rightarrow$  look at 2D- occupancy

# Phase0, $\xi=7$

Efficiency, fake rate, generated tracks vs. true particle energy, Bayesian error bars

# What's next?

- Creating similar plots with efficiency vs. track angle with respect to the beam line
- Also efficiency plots with:
  - analytically solved (Sub-)QUBO's
  - VQE, noiseless sim and Fake Devices
- Efficiency might be not improved with our current optimisation strategy → explore other strategies
