Acceleration electron bunches to GeV level

Electron bunch spectrum

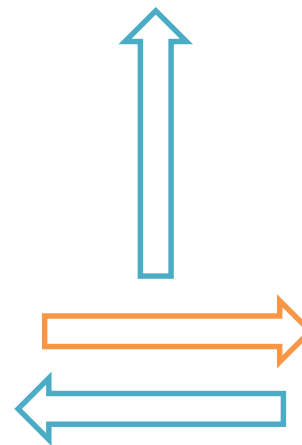

Optimization parameter
for particle beams
- peak energy
- bandwidth
- charge
- pointing

- GeV beams with ultra low beam
  divergence < 0.5 mrad^2
- pointing fluctuations on same order
  as divergence

**Experiment**

**Online laser diagnostic
& control**

PIC simulations

Cryo cooled power amplifier

- 100 W pumping power @532 nm

- target temperature 90 K to reduce the thermal lens of the Ti:Sapphire crystal

- Helium expander cryo head

HI JENA

Helmholtz Institute Jena

-   no vibrations anymore

recent LWFA experiments beam pointing

- LWFA with ionization injection (95% helium, 5% nitrogen)
- super sonic gas jet

Jitter for electron bunches is **m**rad while for the laser beam is **μ**rad.

horizontal direction
old CRYO jitter: 6.5 mrad (rms)
new CRYO jitter: 4.7 mrad (rms)
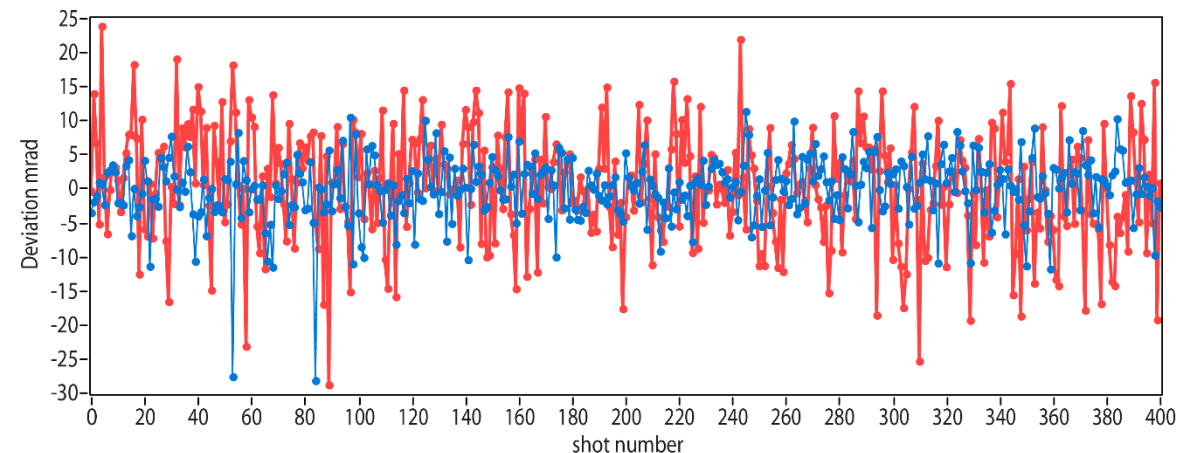

vertical direction
old CRYO jitter: 8.4 mrad (rms)
new CRYO jitter: 4.6 mrad (rms)

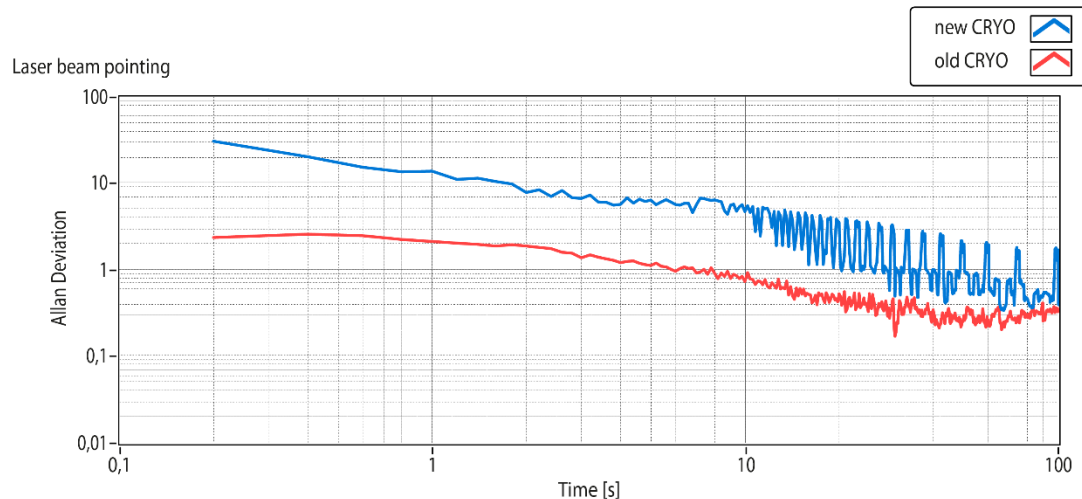

Electron beam pointing (horizontal)

Electron beam pointing (vertical)

Comparison CRYO cooler (vertical direction)

Laser beam pointing

Focal spot diameter: ~10 µrad
old CRYO jitter: 30 µrad (rms)
new CRYO jitter: 4 µrad (rms)

**Long term drift only depends on environment.
(temperature, humidity, air pressure)**

Data from old CRYO too erratic for ML. Need for higher sampling rate.
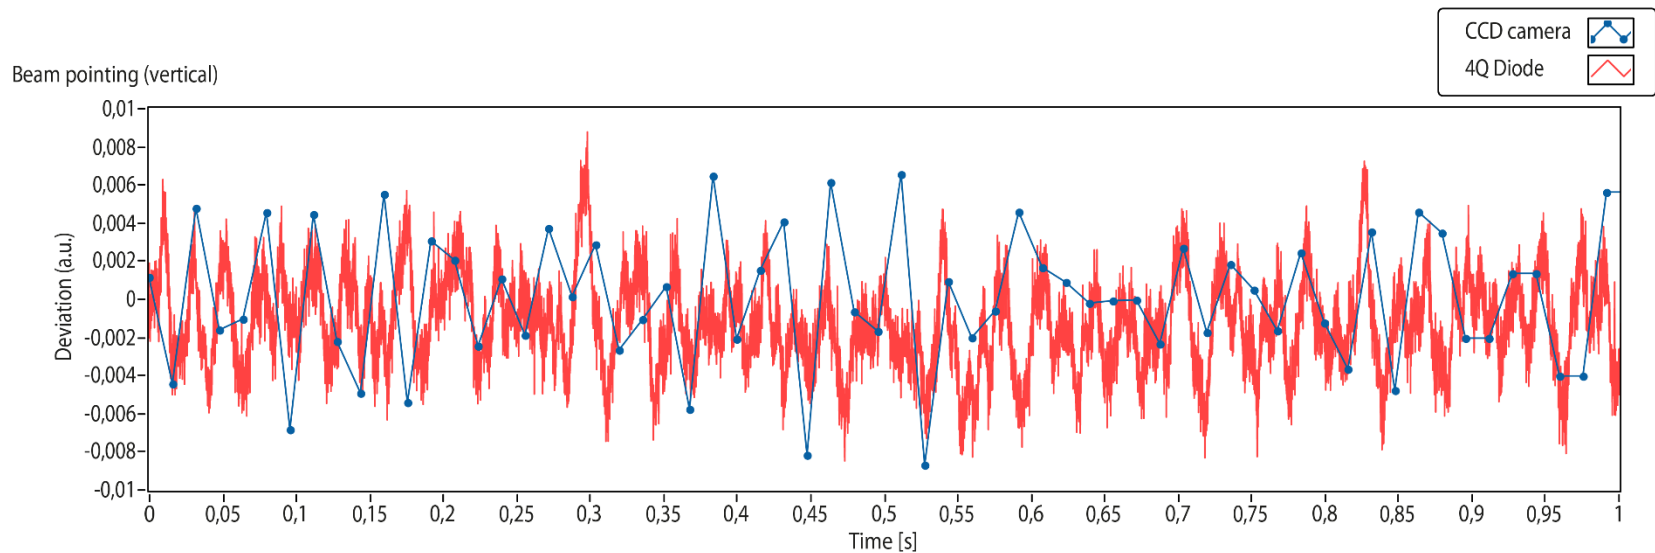

Active beam stabilization

For online measurement: Use transmitted light through high reflective mirrors and focus the beam on the CCD (already used for data logging)

HI JENA
Helmholtz Institute Jena

Data recording

- using 4Q Diode for high temporal resolution (10 kHz) instead of CCD camera (100 Hz)
- no post evaluation necessary
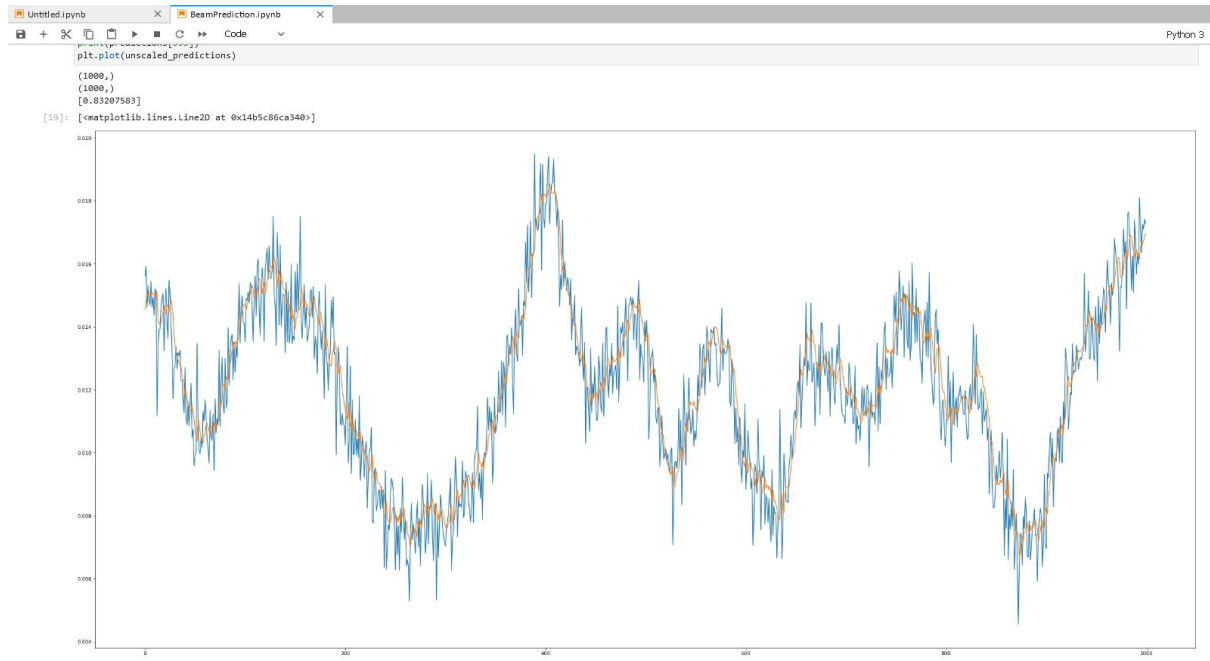

Data recording

Much better training data but much computation time increases significantly.
Long term prediction (> 1 seconds) gets difficult.

ML algorithm

Switching from first demonstration with selfwritten Labview program to python and tensorflow. Computational acceleration by GPUs.

Good news: It works!

Bad news: prediction not accurate for different times of the day (morning vs. afternoon)

HI JENA
Helmholtz Institute Jena

Outlook for 2022/23

- Online measurement of beam fluctuations with > 10 kHz

- establish reliable model for beam prediction
