$$f(k_1, \dots, k_L) = \frac{1}{D_1^{n_1} \cdots D_N^{n_N}}$$

$D_i$  are linear functions of  $s_{ij} = k_i \cdot q_j$

Point in  $L$ -dimensional integer space

For irreducible numerators,  $n_i \leq 0$

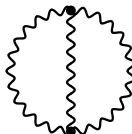

Dimensionality: 0 scales

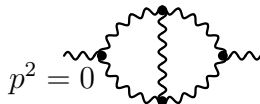

$$[\text{mass}]^{Ld-n}$$

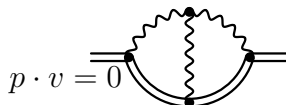

# Dimensionality: 0 scales

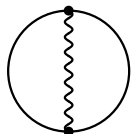

$$[\text{mass}]^{Ld-n}$$

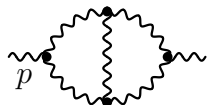

$$= 0$$

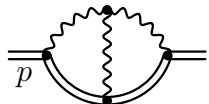

$$p^2 = 0$$
$$= 0$$

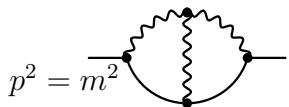

$$p \cdot v = 0$$
$$= 0$$

# Dimensionality: 1 scale

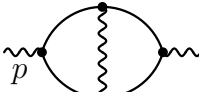

$$= m^{Ln-n} I(d)$$

$$= (-p^2)^{Ld/2-n} I(d)$$

$$= (-2p \cdot v)^{Ld-n} I(d)$$

$$p^2 = m^2 = m^{Ld-n} I(d)$$

## Dimensionality: 2 scales

$$= m^{Ld-n} I \left( d; \frac{-p^2}{m^2} \right)$$

$$= m^{Ld-n} I \left( d; \frac{-p^2}{m^2} \right)$$

$$= m^{Ld-n} I \left( d; \frac{-2p \cdot v}{m^2} \right)$$

## Dimensionality: 2 scales

The image shows two Feynman diagrams, each representing a loop integral with two scales. The top diagram is a circle with a dashed vertical line connecting the top and bottom vertices, with arrows pointing downwards. The bottom diagram is a circle with a dashed horizontal line connecting the left and right vertices, with arrows pointing to the right. Both diagrams have external lines: the top one has two external lines at the top and bottom, and the bottom one has two external lines at the left and right. The bottom diagram is labeled with  $p^2 = m^2$  on the left external line.

$$\begin{aligned} &= m^{Ld-n} I \left( d; \frac{m'}{m} \right) \\ p^2 = m^2 &= m^{Ld-n} I \left( d; \frac{m'}{m} \right) \end{aligned}$$

# Ordering

## Statement of the problem

Suppose we have  $n$  variables  $x_1, \dots, x_n$ . They are not independent, but satisfy some polynomial equations  $p_1 = 0, \dots, p_m = 0$  ( $p_j$  are polynomials of  $x_i$ ). Let's consider a polynomial  $q$ . Is it equal to 0 due to the constraints on our variables? If there is another polynomial  $q_2$ , there is the question of their equality.

## Statement of the problem

Suppose we have  $n$  variables  $x_1, \dots, x_n$ . They are not independent, but satisfy some polynomial equations  $p_1 = 0, \dots, p_m = 0$  ( $p_j$  are polynomials of  $x_i$ ). Let's consider a polynomial  $q$ . Is it equal to 0 due to the constraints on our variables? If there is another polynomial  $q_2$ , there is the question of their equality.

These questions would become very easy if we had an algorithm reducing polynomials of dependent variables to a canonical form. Two equal polynomials reduce to the same canonical form; a polynomial equal to 0 reduces to the canonical form 0.

## Statement of the problem

Suppose we have  $n$  variables  $x_1, \dots, x_n$ . They are not independent, but satisfy some polynomial equations  $p_1 = 0, \dots, p_m = 0$  ( $p_j$  are polynomials of  $x_i$ ). Let's consider a polynomial  $q$ . Is it equal to 0 due to the constraints on our variables? If there is another polynomial  $q_2$ , there is the question of their equality.

These questions would become very easy if we had an algorithm reducing polynomials of dependent variables to a canonical form. Two equal polynomials reduce to the same canonical form; a polynomial equal to 0 reduces to the canonical form 0.

We can try to use the equations  $p_j = 0$  for simplifying the polynomial  $q$ , i.e. for replacing its more complicated terms by combinations of simpler ones. But to do so we first have to accept some convention which terms are more complicated and which are more simple.

# Monomial orders

We need a total order of monomials (i.e. products of powers of the variables  $x_1^{n_1} \cdots x_n^{n_n}$ ). An order is total if for any monomials  $s$  and  $t$  either  $s < t$ , or  $s > t$ , or  $s = t$  is true.

An order is admissible if two properties are satisfied:

- ▶  $1 \leq s$  for any monomial  $s$ ,
- ▶ if  $s < t$  then  $su < tu$  for any monomial  $u$ .

# Monomial orders

## Lexicographic order

We are comparing two monomials:  $s = x_1^{n_1} x_2^{n_2} \cdots x_n^{n_n}$  and

$$t = x_1^{m_1} x_2^{m_2} \cdots x_n^{m_n}$$

- ▶  $n_1 > m_1 \Rightarrow s > t$
- ▶  $n_1 < m_1 \Rightarrow s < t$
- ▶  $n_1 = m_1$ 
  - ▶  $n_2 > m_2 \Rightarrow s > t$
  - ▶  $n_2 < m_2 \Rightarrow s < t$
  - ▶  $n_2 = m_2$
  - ...

# Monomial orders

## Lexicographic order

We are comparing two monomials:  $s = x_1^{n_1} x_2^{n_2} \cdots x_n^{n_n}$  and  $t = x_1^{m_1} x_2^{m_2} \cdots x_n^{m_n}$

- ▶  $n_1 > m_1 \Rightarrow s > t$
- ▶  $n_1 < m_1 \Rightarrow s < t$
- ▶  $n_1 = m_1$ 
  - ▶  $n_2 > m_2 \Rightarrow s > t$
  - ▶  $n_2 < m_2 \Rightarrow s < t$
  - ▶  $n_2 = m_2$

...

## By total degree than lexicographic

First we compare the total degree  $n = n_1 + n_2 + \cdots + n_n$  of the monomial  $s$  and the total degree

$m = m_1 + m_2 + \cdots + m_n$  of the monomial  $t$ .

- ▶  $n > m \Rightarrow s > t$
- ▶  $n < m \Rightarrow s < t$
- ▶  $n = m$  — compare lexicographically

# Reduction of polynomials

Let's fix some admissible monomial order. We'll write polynomials in descending order: the leading term first, followed by the rest ones. We'll normalize all polynomials  $p_j$  in such a way that the coefficient of the leading term is 1. Now they can be used as substitutions which replace the leading term by minus sum of the remaining ones.

# Example

Lexicographic order with  $x > y$

$$p_1 = x^2 + y^2 - 1 \quad p_2 = xy - \frac{1}{4}$$

$$q = x^2y$$

# Example

Lexicographic order with  $x > y$

$$p_1 = x^2 + y^2 - 1 \quad p_2 = xy - \frac{1}{4}$$

$$\begin{array}{l} p_1 : \\ x^2 \rightarrow -y^2 + 1 \\ q = x^2 y \end{array} \quad \nearrow \quad q_1 = -y^3 + y$$

# Example

Lexicographic order with  $x > y$

$$p_1 = x^2 + y^2 - 1 \quad p_2 = xy - \frac{1}{4}$$

$$\begin{array}{l} p_1 : \\ x^2 \rightarrow -y^2 + 1 \\ \qquad \nearrow \\ q = x^2 y \\ \qquad \searrow \\ p_2 : \\ xy \rightarrow \frac{1}{4} \\ \qquad \searrow \\ \qquad \qquad q_2 = \frac{1}{4} x \end{array} \quad \begin{array}{l} q_1 = -y^3 + y \\ \\ \\ \\ \\ \\ \\ q_2 = \frac{1}{4} x \end{array}$$

# Definition

Every time when more than one substitution can be applied to a term of a polynomial  $q$ , a fork appears; maybe, its branches join later, but maybe, they don't.

A set of polynomials  $p_1, \dots, p_n$  is called a *Gröbner basis* (for a given monomial order) if reduction of any polynomial  $q$  with respect to this set is unique.

(This definition is not constructive.)

# $S$ -polynomials

The constraints  $p_1 = 0$  and  $p_2 = 0$  allow us to simplify the monomials  $x^2$  and  $xy$ . Do these constraints contain an extra information usable for simplification but not obvious? Yes, they do!

# $S$ -polynomials

The constraints  $p_1 = 0$  and  $p_2 = 0$  allow us to simplify the monomials  $x^2$  and  $xy$ . Do these constraints contain an extra information usable for simplification but not obvious? Yes, they do!

$$p_1 = x^2 + y^2 - 1 = 0$$

$$p_2 = xy - \frac{1}{4} = 0$$

# $S$ -polynomials

The constraints  $p_1 = 0$  and  $p_2 = 0$  allow us to simplify the monomials  $x^2$  and  $xy$ . Do these constraints contain an extra information usable for simplification but not obvious? Yes, they do!

$$p_1 = x^2 + y^2 - 1 = 0 \quad \times y \quad x^2y + y^3 - y = 0$$

$$p_2 = xy - \frac{1}{4} = 0 \quad \times x \quad x^2y - \frac{1}{4}x = 0$$

# $S$ -polynomials

The constraints  $p_1 = 0$  and  $p_2 = 0$  allow us to simplify the monomials  $x^2$  and  $xy$ . Do these constraints contain an extra information usable for simplification but not obvious? Yes, they do!

$$p_1 = x^2 + y^2 - 1 = 0 \quad \times y \quad x^2y + y^3 - y = 0$$

$$p_2 = xy - \frac{1}{4} = 0 \quad \times x \quad x^2y - \frac{1}{4}x = 0$$

$$\frac{1}{4}x + y^3 - y = 0$$

# $S$ -polynomials

The constraints  $p_1 = 0$  and  $p_2 = 0$  allow us to simplify the monomials  $x^2$  and  $xy$ . Do these constraints contain an extra information usable for simplification but not obvious? Yes, they do!

$$p_1 = x^2 + y^2 - 1 = 0 \quad \times y \quad x^2y + y^3 - y = 0$$

$$p_2 = xy - \frac{1}{4} = 0 \quad \times x \quad x^2y - \frac{1}{4}x = 0$$

$$\frac{1}{4}x + y^3 - y = 0$$

$S$ -polynomial  $S(p_1, p_2)$

$$p_3 = x + 4y^3 - 4y$$

# Example

Lexicographic order with  $x > y$

$$p_1 = x^2 + y^2 - 1 \quad p_2 = xy - \frac{1}{4}$$

$$\begin{array}{l} p_1 : \\ x^2 \rightarrow -y^2 + 1 \\ \qquad \nearrow \\ q = x^2 y \\ \qquad \searrow \\ p_2 : \\ xy \rightarrow \frac{1}{4} \\ \qquad \searrow \\ \qquad \qquad q_2 = \frac{1}{4} x \end{array}$$

$q_1 = -y^3 + y$

# Example

Lexicographic order with  $x > y$

$$p_1 = x^2 + y^2 - 1 \quad p_2 = xy - \frac{1}{4}$$

# Reduced Gröbner basis

$p_1, p_2, p_3$  form a Gröbner basis (though we have not proven this). We can reduce them with respect to each other (omitting vanishing polynomials). The reduced Gröbner basis is

$$\begin{aligned}p_1 &= y^4 - y^2 + \frac{1}{16} \\p_2 &= x + 4y^3 - 4y\end{aligned}$$

It has triangular structure.

# Buchberger algorithm

Given a set of polynomials  $P = \{p_j\}$

- ▶  $S =$  set of all pairs  $(i, j)$  of integer numbers from 1 to  $n$  with  $i < j$
- ▶ **while**  $S$  is not empty
- ▶     Choose and remove some pair  $(i, j)$  from  $S$
- ▶     Calculate  $S$ -polynomial  $S(p_i, p_j)$
- ▶     Reduce it with respect to  $P$
- ▶     if the result is not 0, add this polynomial to  $P$  and the corresponding pairs to  $S$

# Buchberger algorithm

Given a set of polynomials  $P = \{p_j\}$

- ▶  $S =$  set of all pairs  $(i, j)$  of integer numbers from 1 to  $n$  with  $i < j$
- ▶ **while**  $S$  is not empty
- ▶     Choose and remove some pair  $(i, j)$  from  $S$
- ▶     Calculate  $S$ -polynomial  $S(p_i, p_j)$
- ▶     Reduce it with respect to  $P$
- ▶     if the result is not 0, add this polynomial to  $P$  and the corresponding pairs to  $S$

The set of pairs  $S$  alternatingly shrinks and grows. But it can be proved that this process terminates after a finite number of steps, and produces a Gröbner basis  $P$ .

# Sectors and corners

$$I(n_1, n_2) = (\mathbf{1}^-)^{-n_1} (\mathbf{2}^+)^{n_2-1} I(0, 1)$$

# Normal form of IBP relations in a sector

$$\sum_{j_1 j_2} C_{j_1 j_2}(n_i) (\mathbf{1}^-)^{j_1} (\mathbf{2}^+)^{j_2} \sim 0$$

# S-bases

Find a Gröbner-like basis, reduce  $(\mathbf{1}^-)^{-n_1} (\mathbf{2}^+)^{n_2-1}$   
and apply to  $I(0, 1)$

# Gröbner bases for PDE

Each line has a separate mass  $m_i$

$$\frac{\partial}{\partial m_i^2} \Rightarrow -\mathbf{n}_i \mathbf{i}^+$$

IBP

$$\sum C_{j_1 \dots j_N}(m_1^2, \dots, m_N^2) \left( \frac{\partial}{\partial m_1^2} \right)^{j_1} \cdots \left( \frac{\partial}{\partial m_N^2} \right)^{j_N} \sim 0$$

2-loop self-energy diagrams with all different masses

# Approaches

- ▶ Generic  $n_i$ 
  - ▶ Construct an algorithm and implement by hand:  
`Mincer`, ...
  - ▶ More automated approaches
    - ▶ Gröbner-based approaches
    - ▶ Lie-algebra based approaches
    - ▶ Baikov's methods
- ▶ Specific numeric  $n_i$ : Laporta algorithm  
(`Air`, `FIRE`, `reduze...` )
