

# Online Steering in gLite with RMOST

Daniel Lorenz  
University of Siegen  
Monitoring Workshop, Wuppertal  
20.-21. 6. 2007

GEFÖRDERT VOM

Bundesministerium  
für Bildung  
und Forschung

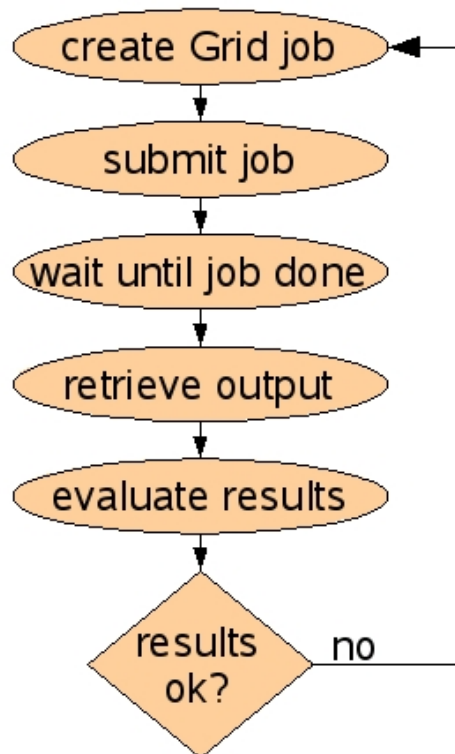

# Overview

- Introduction
- Functionality
- RMOST components
  - Steering library
  - File access library
  - Grid connection
- Summary

# Online Steering

## Usage cycle of Grid jobs

- Online steering
  - Create interactive connection to running job
  - Online monitoring of intermediate results
  - Interactive control of the job
- Advantage:
  - Usage of less resources
  - Accelerate scientific cycles
  - Immediate reaction on changes

# RMOST

- RMOST is a **R**esult **M**onitoring and **O**nline **S**teering **T**ool
  - Supports jobs of the LHC experiment ATLAS.
- Application **independent** implementation.
- **Thin interface** layer to ATLAS specific software.
- Basic functionality can be used **without** source code **changes** of ATLAS software.
- Visualization with plug-ins to **common** physics tools.
- **Minimize** instrumentation effort to enable steering.

# RMOST Functionality (1)

## ■ Basic functionality

- Can be applied **without** source code **changes**
- **Visualization** of intermediate results in files
- Monitoring of job **progress**
- **Modification** of job description file. Application of the modification via restart of the job without resubmission of the job
- **Control** of job execution: terminate, restart, suspend, continue, stepwise execution
- Optional **delay, notification, and interaction possibility** after unexpected, graceful termination of the job
- Optional notification on job start and end.

# RMOST Functionality (2)

## ■ Advanced functionality

- Visualization of **internal** data and variables
- Modification of data in **arbitrary** storage
- Application of modifications at **any** time
- **User defined** notifications on user defined conditions
- **Preevaluation** of data
- On demand execution of operations

## ■ Notifications

- Via steering tool
- Via email if supported

# Visualization

The screenshot displays two windows of the ResultMonitor application. The top window shows the job configuration for a job named 'https://grid-rb.physik.uni-wuppertal.de:9000/Fjxz\_muKM8SbmtvXAflTOA'. It lists parameters such as 'PythiaB', 'eventCounter', 'nextAction', 'pythiaB.pool.root', and 'pythiaB.root' with their respective data types and values. The bottom window shows a list of jobs with their progress and notifications.

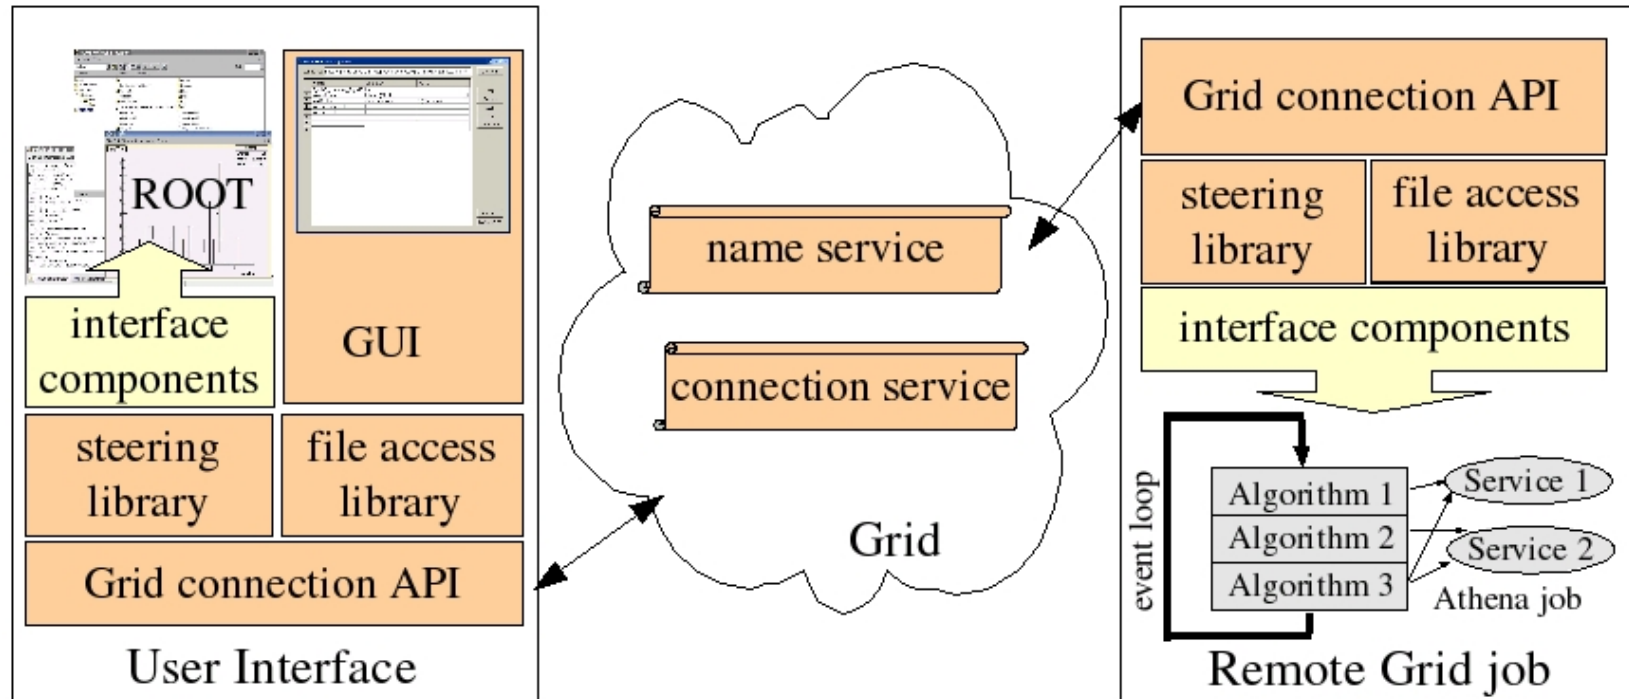

Name	Data type	Value
1 PythiaB bbmu6X_Signal3	file	
2 eventCounter	integer (32 bit)	14
3 nextAction	steering value	0 (Continue)
4 pythiaB.pool.root	file	
5 pythiaB.root	file	

ID	Progress	Notification
1 Wasgf2opdBcypcidC	Searching for the job	RM_TCP_Connection::con
2 gTiushds0haHHswiwd	Events: 703	
3 Fhdkad8ferrGhajsPqs	Events: 223	
4 edsw7uaskHjswoQAga	Events: 734	
5 hsTkLaQaasbcjwod0s	Events: 825	
6 gdaoJospwsLoasPisw	Events: 166	

- Job management
- Connection to job
- Overview on job progress
- Detailed view of a job
- Display and modify values of basic data types
- Download and upload files

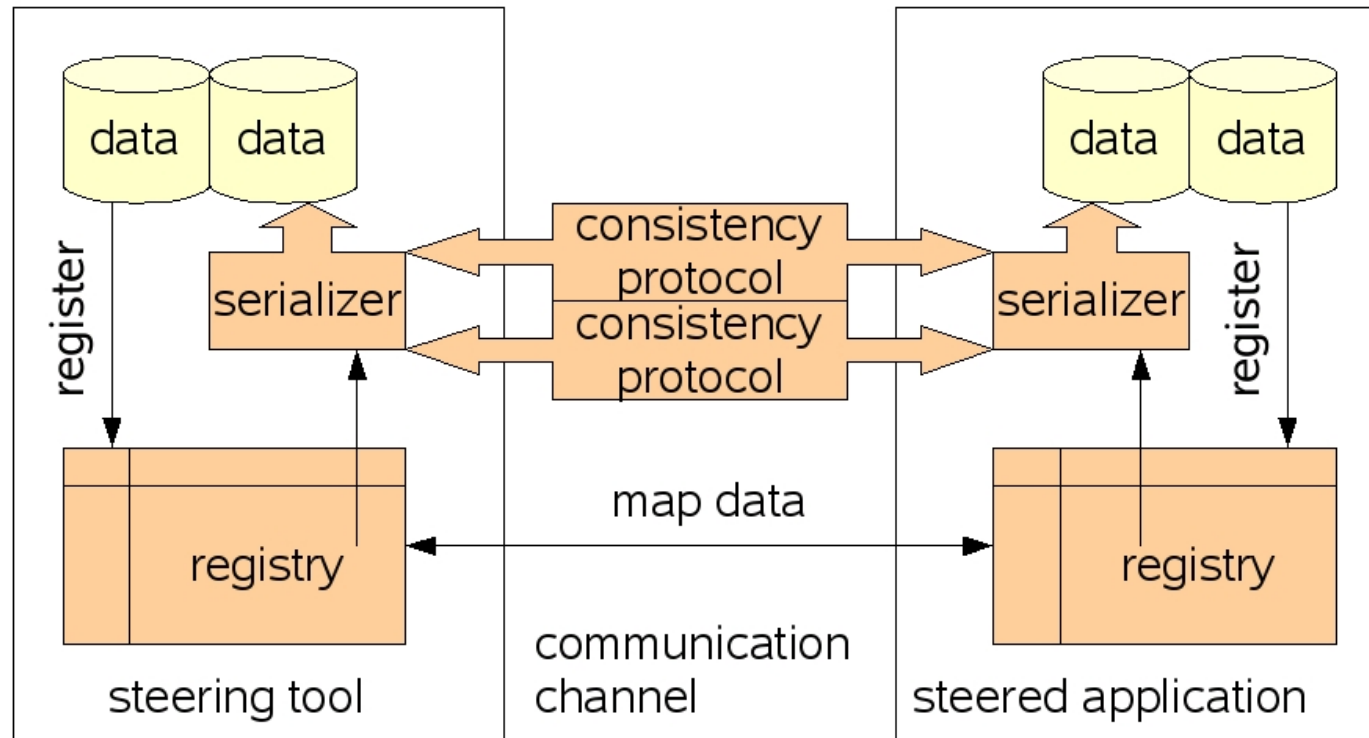

# RMOST Components

- Main libraries are application independent
- Thin interface layer to ATLAS software
- Reusability of most components

# Steering library

- Distributed shared memory model for steering
  - Data exchange at synchronization points
  - Asynchronous data exchange possible

# Steering library

- Keep copies of data at both sides **consistent**
- Data must be registered
- Definition of synchronization points
  - Data is in a well **defined** state for visualization
  - **Safe** application of modifications
- Asynchronous data exchange possible
- **Extendable** with new data types
  - Requires provision of serializers
- **Notification** mechanism through:
  - Steering connection
  - Email, if supported

# File Access library

- Preloaded library overwrites system calls for file access

# File Access Library

- Results are **often stored** in files
- **No serializers** necessary
- **No instrumentation** for each access
- Registration of files:
  - Via environment variable  $\Rightarrow$  **no** source code **changes** necessary
  - Via library call  $\Rightarrow$  **dynamic** registration during runtime of application

# Interactive Grid Connection

- Connection required
- Initiated by the user
- Connection must be secure
- Job runs on unknown host

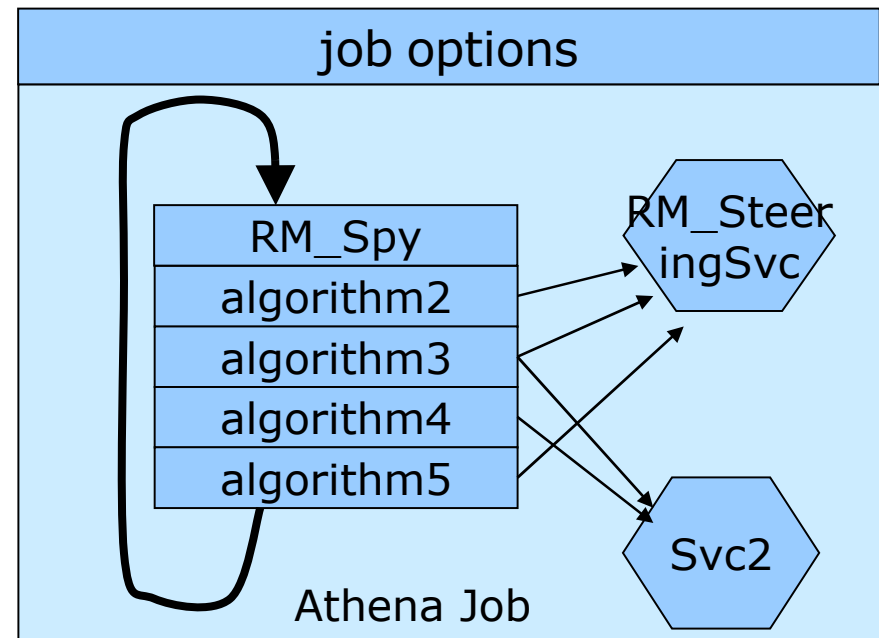

- Sites may be protected by firewalls
- Sites may have private IP networks
- Sites may have different configurations
- Configurations are unknown at submission time

# Interactive Grid Connection

- Establishes an interactive connection to a Grid job in as many **cases** as **possible**.
- Uses job identifier as **address**
  - Uses R-GMA as name service
  - Want to exchange R-GMA
- Deals dynamically with **connectivity** problems due to:
  - firewalls
  - private IP networks
- Uses **GSSAPI** for authentication and authorization
  - Tested with gLite and Globus TK4
- Optional **encryption**

# Integration in ATLAS Software

- Athena framework
  - Compose a job of Athena components
  - Configuration in job options
  - Users can add new components
- Basic functionality through an additional algorithm
- Advanced functionality through a service
  - Can be used by other components

# Summary

- Application independent framework
- Thin application specific functionality
- Automated data exchange between job and steering tool
- Handles data consistency
- Special support for file access
- Interactive Grid connection
