November 15, 2022

## Design concept

Proposed approach assumes modular structure of the frame.

Current design includes main frame for tungsten planes only.

Design should probably be extended to include (as independent modules):

- frame for holding PCBs (connected with sensor layers)
- frame support for proper positioning on the table
- additional structures for holding cables, covers etc.
- mechanical arm for lowering PCBs with sensor planes in the structure

But many details required for their design are still missing...

## Questions to be answered

### Tungsten plane frame

⇒ Tungsten plates dimensions still to be fixed...

## Questions to be answered

### Tungsten plane frame

⇒ Tungsten plates dimensions still to be fixed...

### Sensor plane frame

We assume sensor planes supported by kapton foils connected to PCBs.

But details are missing:

- ⇒ Final structure (dimensions) of the sensor planes (+ envelope, if needed)
- ⇒ How sensor planes are connected to PCBs.
- ⇒ PCB design: dimensions and how to securely fixed them to the frame

## Questions to be answered

### Tungsten plane frame

⇒ Tungsten plates dimensions still to be fixed...

### Sensor plane frame

We assume sensor planes supported by kapton foils connected to PCBs.

But details are missing:

- ⇒ Final structure (dimensions) of the sensor planes (+ envelope, if needed)
- ⇒ How sensor planes are connected to PCBs.
- ⇒ PCB design: dimensions and how to securely fixed them to the frame

### Frame support

It should probably allow for adjusting frame position.

- ⇒ How many degrees of freedom should we consider?
- ⇒ What is the required range and precision?
- ⇒ Is there any dedicated interface to the experimental table considered?
