Outline

Introduction

Feynman & Lee-Pomeransky representation

Method of Regions (MoR)

Hidden regions due to cancellation

Integrals with Pinch Singularities

Finding integrals with pinch singularities for *generic* kinematics

Evaluating such integrals in parameter space

MoR and Hidden Regions due to Cancellation

On-Shell & Forward Scattering

Introduction

Parameter Space

Can exchange integrals over loop momenta for integrals over parameters

Feynman Parametrisation

$$I(\mathbf{s}) = \frac{\Gamma(\nu - LD/2)}{\prod_{e \in G} \Gamma(\nu_e)} \int_0^\infty [d\boldsymbol{\alpha}] \boldsymbol{\alpha}^\nu \delta(1 - H(\boldsymbol{\alpha})) \frac{[\mathcal{U}(\boldsymbol{\alpha})]^{\nu - (L+1)D/2}}{[\mathcal{F}(\boldsymbol{\alpha}; \mathbf{s})]^{\nu - LD/2}}$$

$[d\boldsymbol{\alpha}] = \prod_{e \in G} \frac{d\alpha_e}{\alpha_e}$ $\boldsymbol{\alpha}^\nu = \prod_{e \in G} \alpha_e^{\nu_e}$

\mathcal{U}, \mathcal{F} homogeneous polynomials of degree L and $L + 1$

Lee-Pomeransky Parametrisation

$$I(\mathbf{s}) = \frac{\Gamma(D/2)}{\Gamma((L+1)D/2 - \nu) \prod_{e \in G} \Gamma(\nu_e)} \int_0^\infty [d\mathbf{x}] \mathbf{x}^\nu (\mathcal{G}(\mathbf{x}, \mathbf{s}))^{-D/2}$$

$$\mathcal{G}(\mathbf{x}; \mathbf{s}) = \mathcal{U}(\mathbf{x}) + \mathcal{F}(\mathbf{x}; \mathbf{s})$$

Lee, Pomeransky 13

Method of Regions

Consider expanding an integral about some limit:

$$p_i^2 \sim \lambda Q^2, \quad p_i \cdot p_j \rightarrow \lambda Q^2 \quad \text{or} \quad m^2 \sim \lambda Q^2 \quad \text{for} \quad \lambda \rightarrow 0$$

Issue: integration and series expansion do not necessarily commute

Method of Regions

$$I(\mathbf{s}) = \sum_R I^{(R)}(\mathbf{s}) = \sum_R T_t^{(R)} I(\mathbf{s})$$

1. Split integrand up into regions (R)
2. Series expand each region in λ
3. Integrate each expansion over the whole integration domain
4. Discard scaleless integrals (= 0 in dimensional regularisation)
5. Sum over all regions

Smirnov 91; Beneke, Smirnov 97; Smirnov, Rakhmetov 99; Pak, Smirnov 11; Jantzen 2011; ...

Finding Regions

Assuming all c_i have the same sign we rescale $s \rightarrow \lambda^{\omega} s \leftarrow s_i \rightarrow \lambda^{\omega_i} s_i$ Newton Polytope

$$I \sim \int_{\mathbb{R}_{>0}^N} [dx] x^\nu (c_i x^{r_i})^t \rightarrow \int_{\mathbb{R}_{>0}^N} [dx] x^\nu (c_i x^{r_i} \lambda^{r_{i,N+1}})^t \rightarrow \mathcal{N}^{N+1}$$

Normal vectors w/ positive λ component define change of variables $\mathbf{n}_f = (v_1, \dots, v_N, 1)$

$$\mathbf{x} = \lambda^{\mathbf{n}_f} \mathbf{y}, \quad \lambda \rightarrow \lambda$$

Pak, Smirnov 10; Semenova,
A. Smirnov, V. Smirnov 18

Example

$$p(x, \lambda) = \lambda + x + x^2$$

$$\begin{aligned} 1, 2 &\in F^+ \\ 3 &\notin F^+ \end{aligned}$$

Original integral I may then be approximated as $I = \sum_{f \in F^+} I^{(f)} + \dots$

Regions due to Cancellation

What happens if c_i have different signs?

Consider a 1-loop massive bubble at *threshold* $y = m^2 - q^2/4 \rightarrow 0$

$$I = \Gamma(\epsilon) \int d\alpha_1 d\alpha_2 \frac{\delta(1 - \alpha_1 - \alpha_2)(\alpha_1 + \alpha_2)^{-2+2\epsilon}}{\left(\mathcal{F}_{\text{bub}}(\alpha_1, \alpha_2; q^2, y)\right)^\epsilon}$$

$$\mathcal{F}_{\text{bub}} = \frac{q^2}{4}(\alpha_1 - \alpha_2)^2 + y(\alpha_1 + \alpha_2)^2$$

Can split integral into two subdomains $\alpha_1 \leq \alpha_2$ and $\alpha_2 \leq \alpha_1$ then remap

$$\begin{aligned} \alpha_1 &= \alpha'_1/2 \\ \alpha_2 &= \alpha'_2 + \alpha'_1/2 \end{aligned} : \quad \mathcal{F}_{\text{bub},1} \rightarrow \frac{q^2}{4}\alpha'^2_2 + y(\alpha'_1 + \alpha'_2)^2 \quad (\text{for first domain})$$

Jantzen, A. Smirnov, V. Smirnov 12

Before split: only **hard** region found ($\alpha_1 \sim y^0, \alpha_2 \sim y^0$)

After split: also **potential** region found ($\alpha_1 \sim y^0, \alpha_2 \sim y^{1/2}$)

Regions due to Cancellation

Various tools attempt to find such re-mappings using **linear** changes of variables

ASY/FIESTA [Jantzen, A. Smirnov, V. Smirnov 12](#)

Check all pairs of variables (α_1, α_2) which are part of monomials of opposite sign

For each pair, try to build linear combination $\alpha_1 \rightarrow b\alpha'_1, \alpha_2 \rightarrow \alpha'_2 + b\alpha'_1$ s.t negative monomial vanishes

Repeat until all negative monomials vanish **or** warn user

ASPIRE [Ananthanarayan, Pal, Ramanan, Sarkar 18](#); [B. Ananthanarayan, Das, Sarkar 20](#)

Consider Gröbner basis of $\{\mathcal{F}, \partial\mathcal{F}/\alpha_1, \partial\mathcal{F}/\alpha_2, \dots\}$ (i.e. \mathcal{F} and Landau equations)

Eliminate negative monomials with linear transformations $\alpha_1 \rightarrow b\alpha'_1, \alpha_2 \rightarrow \alpha'_2 + b\alpha'_1$

This is not enough to straightforwardly expose all regions in parameter space

Integrals with Pinch Singularities

Landau Equations

Polynomials \mathcal{U}, \mathcal{F} can vanish (gives singularities) for some $\alpha_i \rightarrow 0$ (end-point)

Additionally, due to signs in \mathcal{F} it can vanish due to cancellation of terms

Avoid poles on real axis by deforming contour (roughly speaking...):

$$\alpha_k \rightarrow \alpha_k - i\varepsilon_k(\boldsymbol{\alpha})$$
$$\mathcal{F}(\boldsymbol{\alpha}; \mathbf{s}) \rightarrow \mathcal{F}(\boldsymbol{\alpha}; \mathbf{s}) - i \sum_k \varepsilon_k \frac{\partial \mathcal{F}(\boldsymbol{\alpha}; \mathbf{s})}{\partial \alpha_k} + \mathcal{O}(\varepsilon^2)$$

If $\mathcal{F}(\boldsymbol{\alpha}; \mathbf{s}) = 0$ and $\partial \mathcal{F}(\boldsymbol{\alpha}; \mathbf{s}) / \partial \alpha_j = 0 \quad \forall j$ simultaneously, contour will vanish exactly where the deformation is required, above conditions are just the Landau equations

Landau Equations (parameter space):

- 1) $\mathcal{F}(\boldsymbol{\alpha}; \mathbf{s}) = 0$
- 2) $\alpha_j \frac{\partial \mathcal{F}(\boldsymbol{\alpha}; \mathbf{s})}{\partial \alpha_j} = 0 \quad \forall j$

Leading: $\alpha_j \neq 0 \forall j$

Solutions are *pinched surfaces* of the integral where IR divergences may arise

Looking for Trouble: Algorithm

Generally, solutions of the Landau equations depend on \mathbf{s} .

Let us restrict our search to solutions with *generic* kinematics

$$\mathcal{F} = - \sum_i s_i [f_i(\boldsymbol{\alpha}) - g_i(\boldsymbol{\alpha})] = \sum_i \mathcal{F}_{i,-} + \mathcal{F}_{i,+}$$

$$\mathcal{F}_{i,-} = -s_i f_i(\boldsymbol{\alpha}), \quad \mathcal{F}_{i,+} = s_i g_i(\boldsymbol{\alpha}), \quad f_i(\boldsymbol{\alpha}), g_i(\boldsymbol{\alpha}) \geq 0$$

Algorithm (finds integrals which *potentially* have a pinch for massless case)

For each s_i :

- 1) Compute $\mathcal{F}_{i,-}$, $\mathcal{F}_{i,+}$
- 2) If $\mathcal{F}_{i,-} = 0$ or $\mathcal{F}_{i,+} = 0 \rightarrow$ **Exit (no cancellation)**
- 3) If $\partial \mathcal{F}_{i,-} / \partial \alpha_j = 0$ or $\partial \mathcal{F}_{i,+} / \partial \alpha_j = 0$ set $\alpha_j = 0 \rightarrow$ Goto 1
Else \rightarrow **Exit (potential cancellation)**

Much more sophisticated algorithms for solving Landau equations exist

(E.g.) Mizera, Simon Telen 21; Fevola, Mizera, Telen 23

(See also) Gambuti, Kosower, Novichkov, Tancredi 23

Looking for Trouble: 1- & 2-loops

We considered massless 4-point scattering amplitudes ($s_{23} = -s_{12} - s_{13}$)

@1-loop: found no candidates (trivially)

@2-loop:

+ ... no candidates (!)

Looking for Trouble: 3-loops

@3-loop: finally some interesting candidates

The complete set of corresponding master integrals for generic s_{12}, s_{13} are known
Henn, Mistlberger, Smirnov, Wasser 20; Bargiela, Caola, von Manteuffel, Tancredi 21;

Interesting Example

$$= \int_0^{\infty} dx_0 \dots dx_7 \frac{\mathcal{U}(\mathbf{x})^{4\epsilon}}{\mathcal{F}(\mathbf{x}; \mathbf{s})^{2+3\epsilon}} \delta(1 - x_7)$$

$$\mathcal{U}(\alpha) = \alpha_0 \alpha_2 \alpha_4 + \alpha_0 \alpha_2 \alpha_5 + \alpha_0 \alpha_2 \alpha_6 + (29 \text{ terms})$$

$$\mathcal{F}(\alpha; \mathbf{s}) = -s_{12} (\alpha_1 \alpha_4 - \alpha_0 \alpha_5) (\alpha_3 \alpha_6 - \alpha_2 \alpha_7) - s_{13} (\alpha_1 \alpha_2 - \alpha_0 \alpha_3) (\alpha_5 \alpha_6 - \alpha_4 \alpha_7),$$

$$\frac{\partial \mathcal{F}(\alpha; \mathbf{s})}{\partial \alpha_0} = s_{12} \alpha_5 (\alpha_3 \alpha_6 - \alpha_2 \alpha_7) + s_{13} \alpha_3 (\alpha_5 \alpha_6 - \alpha_4 \alpha_7),$$

⋮

$$\frac{\partial \mathcal{F}(\alpha; \mathbf{s})}{\partial \alpha_7} = s_{12} \alpha_2 (\alpha_1 \alpha_4 - \alpha_0 \alpha_5) + s_{13} \alpha_4 (\alpha_1 \alpha_2 - \alpha_0 \alpha_3)$$

Can have a leading Landau singularity with *generic kinematics* (arbitrary s_{12}, s_{13}) when each factor of \mathcal{F} vanishes!

Interesting Example

Let's try to compute this with sector decomposition (pySecDec)

```
ssh
3:54.738] got NaN from k146; decreasing deformp by 0.9 to (1.1765883620056724e-10, 1.1765883620056724e-10, 1.1765883620056724e-10, 1.176588362005672e-16, 1.176588362005672e-16, 1.176588362005672e-16, 1.176588362005672e-16)

Fails to find contour...

Contour Deformation

Feynman integral (after sector decomp):

$$I \sim \int_0^1 [d\alpha] \alpha^\nu \frac{[\mathcal{U}(\alpha)]^{N-(L+1)D/2}}{[\mathcal{F}(\alpha; \mathbf{s})]^{N-LD/2}}$$

Deform integration contour to avoid poles on real axis

Feynman prescription $\mathcal{F} \rightarrow \mathcal{F} - i\delta$ tells us how to do this

Expand $\mathcal{F}(\mathbf{z} = \boldsymbol{\alpha} - i\boldsymbol{\tau})$ around $\boldsymbol{\alpha}$, $\mathcal{F}(\mathbf{z}) = \mathcal{F}(\boldsymbol{\alpha}) - i \sum_j \tau_j \frac{\partial \mathcal{F}(\boldsymbol{\alpha})}{\partial \alpha_j} + \mathcal{O}(\tau^2)$

Choose $\tau_j = \lambda_j \alpha_j (1 - \alpha_j) \frac{\partial \mathcal{F}(\boldsymbol{\alpha})}{\partial \alpha_j}$ with small constants $\lambda_j > 0$

Soper 99; Binoth, Guillet, Heinrich, Pilon, Schubert 05; Nagy, Soper 06; Anastasiou, Beerli, Daleo 07, 08; Beerli 08; Borowka, Carter, Heinrich 12; Borowka 14;...

Contour Deformation

But for this class of examples $\mathcal{F}(\boldsymbol{\alpha})$ and all $\partial\mathcal{F}(\boldsymbol{\alpha})/\partial\alpha_i$ vanish at the same point inside the integration domain

→ *pinch* singularity

Example

$$\begin{aligned}\mathcal{F}(\boldsymbol{\alpha}; \mathbf{s}) &= -s_{12} (\alpha_1\alpha_4 - \alpha_0\alpha_5) (\alpha_3\alpha_6 - \alpha_2\alpha_7) - s_{13} (\alpha_1\alpha_2 - \alpha_0\alpha_3) (\alpha_5\alpha_6 - \alpha_4\alpha_7), \\ \frac{\partial\mathcal{F}(\boldsymbol{\alpha}; \mathbf{s})}{\partial\alpha_0} &= s_{12} \alpha_5(\alpha_3\alpha_6 - \alpha_2\alpha_7) + s_{13} \alpha_3(\alpha_5\alpha_6 - \alpha_4\alpha_7), \\ &\quad \vdots \\ \frac{\partial\mathcal{F}(\boldsymbol{\alpha}; \mathbf{s})}{\partial\alpha_7} &= s_{12} \alpha_2(\alpha_1\alpha_4 - \alpha_0\alpha_5) + s_{13} \alpha_4(\alpha_1\alpha_2 - \alpha_0\alpha_3)\end{aligned}$$

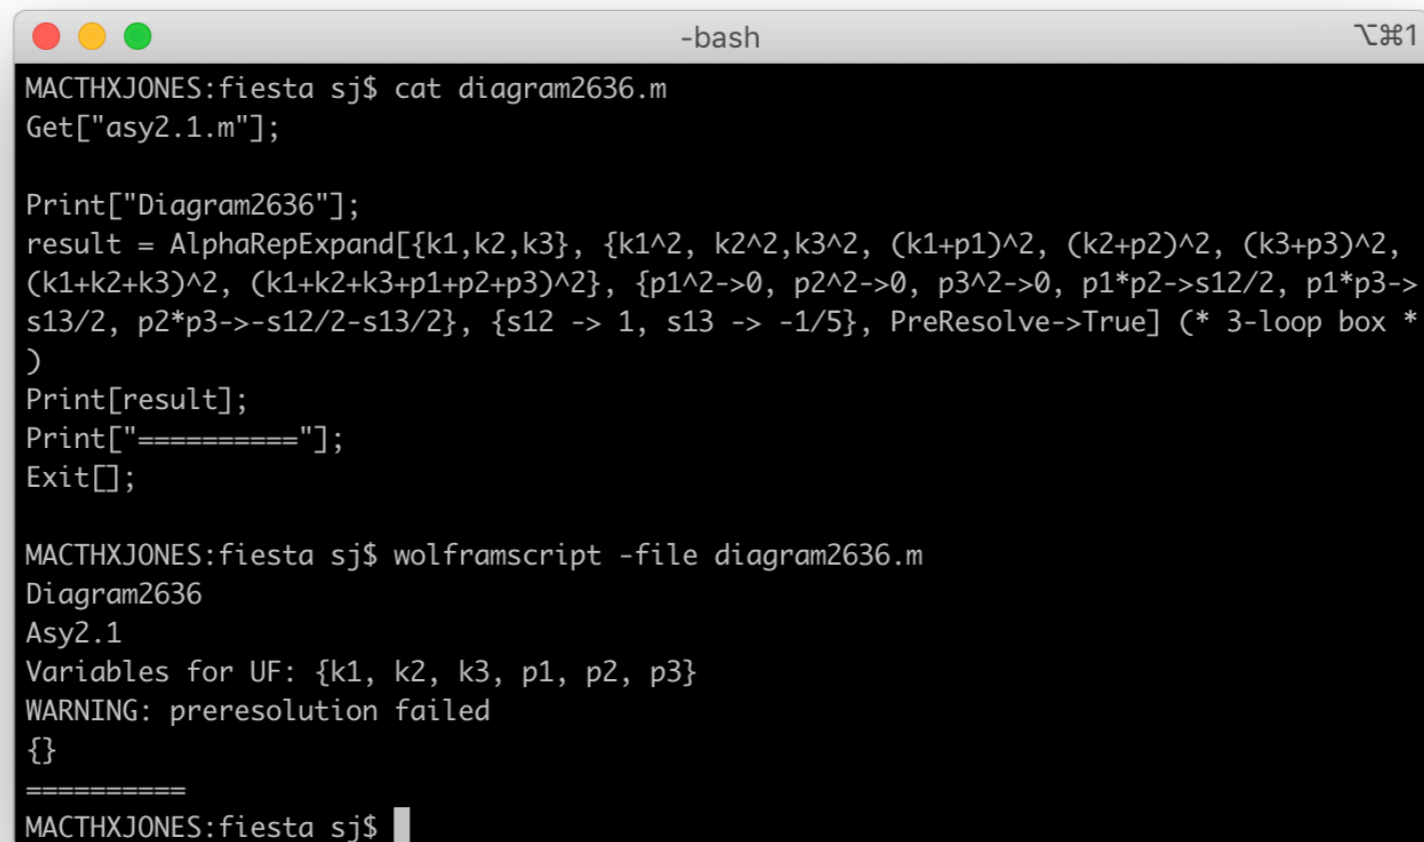

vanish for

$$\alpha_2 = \frac{\alpha_0\alpha_3}{\alpha_1}, \quad \alpha_4 = \frac{\alpha_0\alpha_5}{\alpha_1}, \quad \alpha_6 = \frac{\alpha_0\alpha_7}{\alpha_1}.$$

Resolution

The problem is that we have monomials with different signs...

Asy2.1 PreResolve->True

```

Correctly identifies that iterated linear changes of variables are not sufficient to resolve the singularity and reports that pre-resolution has failed

Resolution

1) Rescale parameters to *linearise* singular surfaces

$$\mathcal{F}(\boldsymbol{\alpha}; \mathbf{s}) = -s_{12} (\alpha_1 \alpha_4 - \alpha_0 \alpha_5) (\alpha_3 \alpha_6 - \alpha_2 \alpha_7) - s_{13} (\alpha_1 \alpha_2 - \alpha_0 \alpha_3) (\alpha_5 \alpha_6 - \alpha_4 \alpha_7)$$

$$\alpha_0 \rightarrow \alpha_0 \alpha_1, \alpha_2 \rightarrow \alpha_2 \alpha_3, \alpha_4 \rightarrow \alpha_4 \alpha_5, \alpha_6 \rightarrow \alpha_6 \alpha_7$$

$$\mathcal{F}(\boldsymbol{\alpha}; \mathbf{s}) = \alpha_1 \alpha_3 \alpha_5 \alpha_7 \left[-s_{12} (\alpha_4 - \alpha_0) (\alpha_6 - \alpha_2) - s_{13} (\alpha_2 - \alpha_0) (\alpha_6 - \alpha_4) \right]$$

2) Split the integral by imposing $\alpha_i \geq \alpha_j \geq \alpha_k \geq \alpha_l$

$$\alpha_0 \rightarrow \alpha_0 + \alpha_2 + \alpha_4 + \alpha_6,$$

$$\alpha_2 \rightarrow \alpha_2 + \alpha_4 + \alpha_6,$$

$$\alpha_4 \rightarrow \alpha_4 + \alpha_6,$$

$$\alpha_6 \rightarrow \alpha_6$$

+perms

$$\mathcal{F}_1(\boldsymbol{\alpha}; \mathbf{s}) = \alpha_1 \alpha_3 \alpha_5 \alpha_7 \left[-s_{12} (\alpha_0 + \alpha_2) (\alpha_2 + \alpha_4) - s_{13} (\alpha_0) (\alpha_4) \right]$$

$$\mathcal{F}_2(\boldsymbol{\alpha}; \mathbf{s}) = \alpha_1 \alpha_3 \alpha_5 \alpha_7 \left[-s_{12} (\alpha_2) (\alpha_0 + \alpha_2 + \alpha_6) + s_{13} (\alpha_0) (\alpha_6) \right]$$

⋮

$$\mathcal{F}_{24}(\boldsymbol{\alpha}; \mathbf{s}) = \alpha_1 \alpha_3 \alpha_5 \alpha_7 \left[-s_{12} (\alpha_2 + \alpha_4) (\alpha_4 + \alpha_6) - s_{13} (\alpha_2) (\alpha_6) \right]$$

All coefficients of s_{12}, s_{13} now have definite sign

Result

Can now obtain results numerically ($s_{12} = 1, s_{13} = -1/5$)

$$I_1 = \epsilon^{-4} [(-3.8842800687 + 5.2359902003j) \pm (4.458 \cdot 10^{-6} + 3.638 \cdot 10^{-6}j)] + \dots$$

$$I_2 = \epsilon^{-4} [(-7.9291803033 + 20.943767810j) \pm (9.149 \cdot 10^{-5} + 1.061 \cdot 10^{-4}j)] + \dots$$

$$I_3 = \epsilon^{-4} [(18.5195704502 - 15.707988011j) \pm (5.897 \cdot 10^{-5} + 5.897 \cdot 10^{-5}j)] + \dots$$

$$I_4 = \epsilon^{-4} [(-13.294034089) \pm (2.068 \cdot 10^{-5})] + \dots$$

$$I_5 = \epsilon^{-4} [(12.7432949988 - 23.561968275j) \pm (1.605 \cdot 10^{-5} + 1.415 \cdot 10^{-5}j)] + \dots$$

$$I_6 = \epsilon^{-4} [(-4.0702330904) \pm (2.018 \cdot 10^{-6})] + \dots$$

Agrees with analytic result

$$I = 4 (I_1 + I_2 + I_3 + I_4 + I_5 + I_6)$$

$$= \epsilon^{-4} [8.34055 - 52.3608j] + \mathcal{O}(\epsilon^{-3})$$

$$I_{\text{analytic}} = \epsilon^{-4} [8.3400403922 - 52.3598775598j] + \mathcal{O}(\epsilon^{-3})$$

Note: even after resolution this integral is slow to compute numerically, possible to vastly improve performance by avoiding contour deformation entirely

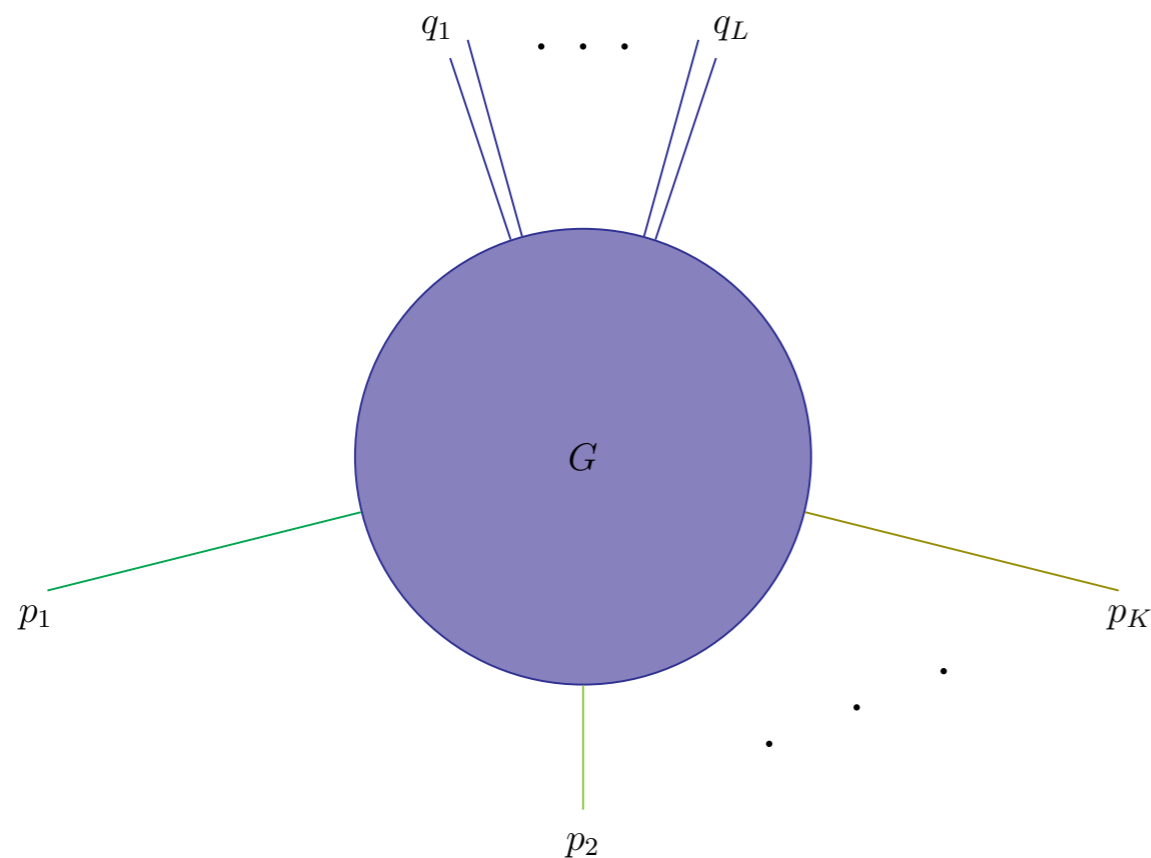

→ See talk of Tom Stone

MoR and Hidden Regions

On-Shell Expansion

On-shell expansion provides a way to explore emergence of IR singularities starting from an object free of IR singularities (off-shell Green's function)

Consider an arbitrary loop, $(K + L)$ -leg wide-angle scattering graph

on-shell: $p_i^2 \sim \lambda Q^2 \quad (i = 1, \dots, K),$
off-shell: $q_j^2 \sim Q^2 \quad (j = 1, \dots, L),$
wide-angle: $p_k \cdot p_l \sim Q^2 \quad (k \neq l).$

Cancellations of the type just observed lead to new regions that are *hidden* in the straightforward Newton polytope approach as they do not originate from an end-point singularity

On-Shell Expansion

Consider a collinear/jet configuration

$$p_i^2 = \lambda Q^2, \quad p_i \cdot v_i \sim \lambda Q, \quad p_i \cdot \bar{v}_i \sim Q, \quad p_i \cdot v_{i\perp} \sim \sqrt{\lambda} Q$$

Let us introduce a fourth (extra) loop momentum and consider the mode with all k_i collinear to p_i

$$k_i^\mu = Q \left(\xi_i v_i^\mu + \lambda \kappa_i \bar{v}_i^\mu + \sqrt{\lambda} \tau_i u_i^\mu + \sqrt{\lambda} \nu_i n^\mu \right)$$

Botts, Sterman 89

Momentum conservation at H_1 vertex ($k_1 + k_2 = k_3 + k_4$)
implies not all ξ_i are independent:

$$\xi_2 = \xi_1 - \frac{1}{2} \sqrt{\lambda} \cos^2(\theta) \left(\tan\left(\frac{\theta}{2}\right) \Delta\tau - \cot\left(\frac{\theta}{2}\right) \Sigma\tau \right) + \lambda(\kappa_2 - \kappa_1),$$

$$\xi_3 = \xi_1 + \frac{1}{2} \sqrt{\lambda} \tan\left(\frac{\theta}{2}\right) \Delta\tau + \lambda(\kappa_2 - \kappa_4),$$

$$\xi_4 = \xi_1 - \frac{1}{2} \sqrt{\lambda} \cot\left(\frac{\theta}{2}\right) \Sigma\tau + \lambda(\kappa_2 - \kappa_3).$$

$$\Delta\tau \equiv \tau_1 + \tau_2 - \tau_3 - \tau_4$$

$$\Sigma\tau = \tau_1 + \tau_2 + \tau_3 + \tau_4$$

On-Shell Expansion

Now let us analyse the leading behaviour of this integrand for small λ ,

- 1) Loop measure can be expressed as $\int d^D k_1 d^D k_2 d^D k_3 = Q^{3D} \int \prod_{i=1}^3 d\xi_i d\kappa_i d\tau_i d\nu_i$
- 2) Trade large components of k_2, k_3 for small components of k_4 , $\{\xi_2, \xi_3\} \rightarrow \{\kappa_4, \tau_4\}$
 Jacobian of transformation: $\det \left(\frac{\partial(\xi_2, \xi_3)}{\partial(\kappa_4, \tau_4)} \right) = \lambda^{3/2} \cos(\theta) \cot(\theta)$

Overall obtain the following scaling:

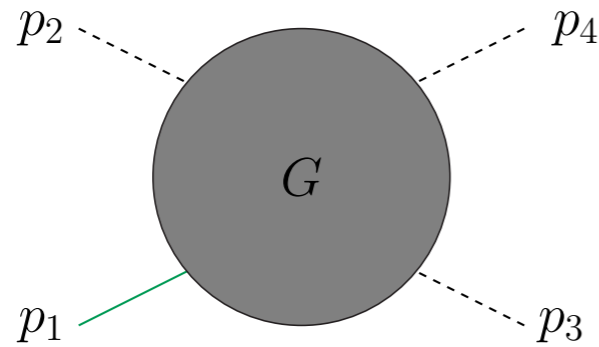

$$\int \prod_{i=1}^3 d\xi_i d\kappa_i d\tau_i d\nu_i \sim \int_0^1 d\xi_1 \underbrace{\left(\int \prod_{i=1}^3 (\lambda d\kappa_i) (\lambda^{\frac{1}{2}} d\tau_i) (\lambda^{\frac{1}{2}} d\nu_i)^{1-2\epsilon} \right)}_{\lambda^{6-3\epsilon}} \int d\kappa_4 d\tau_4 \underbrace{\det \left(\frac{\partial(\xi_2, \xi_3)}{\partial(\kappa_4, \tau_4)} \right)}_{\lambda^{3/2}}$$

Expect this region to scale as $\mu = 6 - 3\epsilon + \frac{3}{2} - 8 = -\frac{1}{2} - 3\epsilon$

Scaling of collinear propagators

On-Shell Expansion

Directly applying MoR in parameter space, we do not see this region...

$$I \sim$$

$v_R (x_0, x_1, \dots, x_7)$	order
$(-2, -1, -2, -1, -2, -1, -2, -1; 1)$	-6ϵ
$(-1, -2, -1, -2, -1, -2, -1, -2; 1)$	-6ϵ
$(-1, -1, -1, 0, -1, 0, -1, 0; 1)$	$1 - 3\epsilon$
$(-1, -1, 0, -1, 0, -1, 0, -1; 1)$	$1 - 3\epsilon$
$(-1, -1, 0, 0, 0, 0, 0, 0; 1)$	$-\epsilon$
$(0, 0, 0, 0, 0, 0, 0, 0; 1)$	0

Dissecting the polytope according to our resolution procedure eliminates monomials of different sign, we now see the region in each of the 24 new polytopes

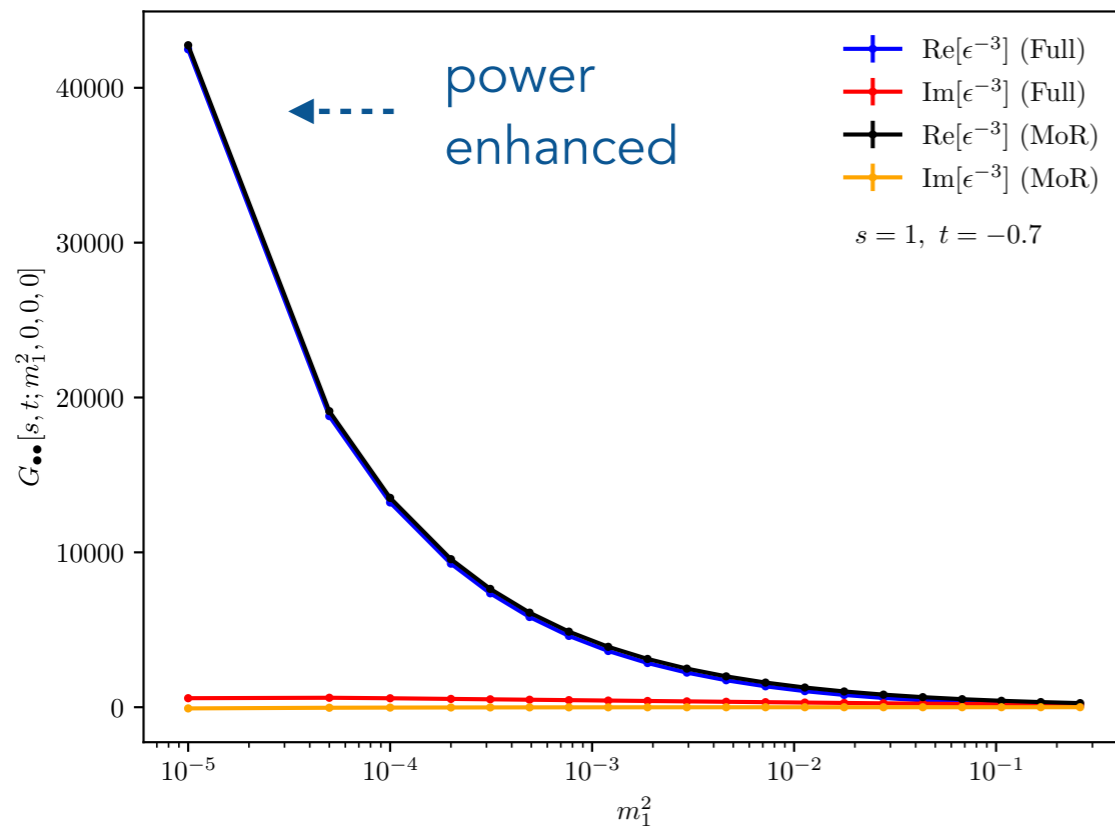

$$I_1 \sim$$

$v_R (y_0, x_1, y_2, x_3, y_4, x_5, y_6, x_7)$	$v_R (x_0, x_1, \dots, x_7)$	order
$(1/2, -1, 1/2, -1, 1/2, -1, 0, -1; 1)$	$(-2, -2, -2, -2, -2, -2, -2, -2; 2)$	$-1/2 - 3\epsilon$
$(0, -1, 1, -1, 1, -1, 0, -1; 1)$	$(-1, -1, -1, -1, -1, -1, -1, -1; 1)$	-3ϵ
$(1, -1, 1, -1, 0, -1, 0, -1; 1)$	$(-1, -1, -1, -1, -1, -1, -1, -1; 1)$	-3ϵ
$(-1, -1, -1, -1, -1, -1, -1, -1; 1)$	$(-2, -1, -2, -1, -2, -1, -2, -1; 1)$	-6ϵ
$(1, -2, 1, -2, 1, -2, 1, -2; 1)$	$(-1, -2, -1, -2, -1, -2, -1, -2; 1)$	-6ϵ
$(0, -1, 0, 0, 0, 0, 0, 0; 1)$	$(-1, -1, 0, 0, 0, 0, 0, 0; 1)$	$-\epsilon$
$(0, 0, 0, 0, 0, 0, 0, 0; 1)$	$(0, 0, 0, 0, 0, 0, 0, 0; 1)$	0

←----- $\mu = -\frac{1}{2} - 3\epsilon$

On-Shell Expansion

Use MoR on each of the split integrals I_1, \dots, I_{24} and summing only the leading region for each split (with $\mu = -1/2 - 3\epsilon$)

See strong numerical evidence that the split integrals (MoR) reproduce the leading behaviour of the full integral in the limit $p_1^2 \rightarrow 0$

Forward Scattering

Inserting $\theta \sim \sqrt{\lambda}$ into the Botts-Sterman analysis leads to one of the loop momenta becoming Glauber:

$$k_4^\mu - k_2^\mu = k_1^\mu - k_3^\mu \sim Q(\lambda, \lambda; \sqrt{\lambda})$$

We obtain $\mu = -1 - 3\epsilon$

Alternatively, can expand known analytic result in the forward limit $x = -s_{13}/s_{12}$
 Henn, Mistlberger, Smirnov, Wasser 20; Bargiela, Caola, von Manteuffel, Tancredi 21;

$$I(s_{12}, s_{13}; \epsilon) = s_{12}^{-2-3\epsilon} \mathcal{F}(x; \epsilon), \quad \mathcal{F}(x; \epsilon) \sum_{n=-4}^{\infty} \mathcal{F}^{(n)}(x) \epsilon^n = \sum_{n=-4}^{\infty} \sum_{k=-1}^{\infty} \mathcal{F}^{(n,k)}(L) x^k \epsilon^n \leftarrow \dots L = \log(x)$$

$$\mathcal{F}(x; \epsilon) = \text{LP} \{ I_{\text{XX}} \} (L; \epsilon) + \mathcal{O}(x^0)$$

$$\text{LP} \{ \mathcal{F} \} (L; \epsilon) = i\pi x^{-1-3\epsilon} \left(-\frac{8}{3\epsilon^4} + \frac{16}{\epsilon^3} + \frac{2(\pi^2 - 144)}{3\epsilon^2} - \frac{4(-58\zeta(3) + 3\pi^2 - 432)}{3\epsilon} \right. \\ \left. + \frac{1}{60} (-27840\zeta(3) + 71\pi^4 + 1440\pi^2 - 207360) + \dots \right),$$

gives $\mathcal{F}(x; \epsilon) \sim x^{-1-3\epsilon}$

Forward Scattering

Directly applying MoR in parameter space, no region with correct scaling...

$I \sim$

$\mathbf{v}_R (x_0, x_1, \dots, x_7)$	order
$(-1, -1, -1, 0, -1, -1, -1, 0; 1)$	-3ϵ
$(-1, -1, 0, -1, -1, -1, 0, -1; 1)$	-3ϵ
$(-1, 0, -1, -1, -1, 0, -1, -1; 1)$	-3ϵ
$(0, -1, -1, -1, 0, -1, -1, -1; 1)$	-3ϵ
$(0, 0, 0, 0, 0, 0, 0, 0; 1)$	0

After resolution, in some polytopes we now directly see the leading region observed in the analytic result!

$\mathbf{v}_R (y_0, x_1, y_2, x_3, y_4, x_5, y_6, x_7)$	$\mathbf{v}_R (x_0, x_1, \dots, x_7)$	order
$(0, -1, 0, -1, 0, -1, 1, -1; 1)$	$(-1, -1, -1, -1, -1, -1, -1, -1; 1)$	$-1 - 3\epsilon$
$(1, -1, 0, -1, 0, -1, 0, -1; 1)$	$(-1, -1, -1, -1, -1, -1, -1, -1; 1)$	$-1 - 3\epsilon$
$(-1, 0, 0, -1, -1, 0, 0, -1; 1)$	$(-1, 0, -1, -1, -1, 0, -1, -1; 1)$	-3ϵ
$(0, 0, 0, 0, 0, 0, 0, 0; 1)$	$(0, 0, 0, 0, 0, 0, 0, 0; 1)$	0

Conclusion

Pinched Feynman Integrals

- Studied an integral with a *pinched* contour independent of kinematics
- Found a resolution procedure to remove the pinch
- Can obtain stable numerical results only after removing pinch

MoR

- Expect regions can appear due to cancelling monomials either generically or at particular kinematic points
- Have characterised some such regions for on-shell expansion and forward scattering @ 3-loops

Outlook

- General/automated procedure to resolve these pinches/cancellations?
- New ways to analyse/compute Feynman integrals?

Thank you for listening!

Sector Decomposition

Sector Decomposition in a Nutshell

$$I \sim \int_{\mathbb{R}_{>0}^{N+1}} [d\mathbf{x}] \mathbf{x}^\nu \frac{[\mathcal{U}(\mathbf{x})]^{N-(L+1)D/2}}{[\mathcal{F}(\mathbf{x}, \mathbf{s}) - i\delta]^{N-LD/2}} \delta(1 - H(\mathbf{x}))$$

Singularities

1. UV/IR singularities when some $x \rightarrow 0$ simultaneously \implies Sector Decomposition
2. Thresholds when \mathcal{F} vanishes inside integration region $\implies i\delta$

Sector decomposition

Find a local change of coordinates for each singularity that factorises it (blow-up)

Sector Decomposition in a Nutshell

$$I \sim \int_{\mathbb{R}_{>0}^N} [d\mathbf{x}] \mathbf{x}^\nu (c_i \mathbf{x}^{\mathbf{r}_i})^t$$

$$\mathcal{N}(I) = \text{convHull}(\mathbf{r}_1, \mathbf{r}_2, \dots) = \bigcap_{f \in F} \left\{ \mathbf{m} \in \mathbb{R}^N \mid \langle \mathbf{m}, \mathbf{n}_f \rangle + a_f \geq 0 \right\}$$

Normal vectors incident to each extremal vertex define a local change of variables*

Kaneko, Ueda 10

$$x_i = \prod_{f \in S_j} y_f^{\langle \mathbf{n}_f, \mathbf{e}_i \rangle}$$

$$I \sim \sum_{\sigma \in \Delta_{\mathcal{N}}^T} |\sigma| \int_0^1 [d\mathbf{y}_f] \underbrace{\prod_{f \in \sigma} y_f^{\langle \mathbf{n}_f, \boldsymbol{\nu} \rangle - t a_f}}_{\text{Singularities}} \left(\underbrace{c_i \prod_{f \in \sigma} y_f^{\langle \mathbf{n}_f, \mathbf{r}_i \rangle + a_f}}_{\text{Finite}} \right)^t$$

*If $|S_j| > N$, need triangulation to define variables (simplicial normal cones $\sigma \in \Delta_{\mathcal{N}}^T$)

Sector Decomposition in a Nutshell

$$I = \text{circle} = -\Gamma(-1 + 2\varepsilon) (m^2)^{1-2\varepsilon} \int_0^\infty \frac{dx_1 dx_2}{(x_1^1 x_2^0 + x_1^1 x_2^1 + x_1^0 x_2^1)^{2-\varepsilon}}.$$

$\mathbf{r}_1 = \begin{pmatrix} 1 \\ 0 \end{pmatrix}, \mathbf{r}_2 = \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \mathbf{r}_3 = \begin{pmatrix} 0 \\ 1 \end{pmatrix}$

$$\mathcal{N}(I) = \text{triangle} = \begin{matrix} \mathbf{r}_3 & \mathbf{n}_2 & \mathbf{r}_2 \\ \mathbf{n}_3 & & \mathbf{n}_1 \\ \mathbf{r}_1 \end{matrix}$$

$$= \begin{matrix} \mathbf{n}_1 = \begin{pmatrix} -1 \\ 0 \end{pmatrix} & \mathbf{n}_2 = \begin{pmatrix} 0 \\ -1 \end{pmatrix} & \mathbf{n}_3 = \begin{pmatrix} 1 \\ 1 \end{pmatrix} \\ a_1 = 1 & a_2 = 1 & a_3 = -1 \end{matrix}$$

For each vertex make the local change of variables

e.g. $\mathbf{r}_1: x_1 = y_1^{-1} y_3^1, x_2 = y_1^0 y_3^1, \mathbf{r}_2: x_1 = y_1^{-1} y_2^0, x_2 = y_1^0 y_2^{-1}, \mathbf{r}_3: x_1 = y_2^0 y_3^1, x_2 = y_2^{-1} y_3^1$

$$I = -\Gamma(-1 + 2\varepsilon) (m^2)^{1-2\varepsilon} \int_0^1 dy_1 dy_2 dy_3 \frac{y_1^{-\varepsilon} y_2^{-\varepsilon} y_3^{-1+\varepsilon}}{(y_1 + y_2 + y_3)^{2-\varepsilon}} [\delta(1 - y_2) + \delta(1 - y_3) + \delta(1 - y_1)]$$

Applications

Applying Expansion by Regions

Ratio of the finite $\mathcal{O}(\epsilon^0)$ piece of numerical result R_n to the analytic result R_a

For large ratio of scales (m^2/s) the EBR result is **faster & easier** to integrate

Additional Regulators

MoR subdivides $\mathcal{N}(I) \rightarrow \{\mathcal{N}(I^R)\} \implies$ new (internal) facets F^{int} .

New facets can introduce spurious singularities not regulated by dim reg

Lee Pomeransky Representation:

$$\mathcal{N}(I^{(R)}) = \bigcap_{f \in F} \left\{ \mathbf{m} \in \mathbb{R}^N \mid \langle \mathbf{m}, \mathbf{n}_f \rangle + a_f \geq 0 \right\}$$

$$I \sim \sum_{\sigma \in \Delta_{\mathcal{N}}^T} |\sigma| \int_{\mathbb{R}_{>0}^N} [d\mathbf{y}_f] \prod_{f \in \sigma} y_f^{\langle \mathbf{n}_f, \boldsymbol{\nu} \rangle + \frac{D}{2} a_f} \left(c_i \prod_{f \in \sigma} y_f^{\langle \mathbf{n}_f, \mathbf{r}_i \rangle + a_f} \right)^{-\frac{D}{2}}$$

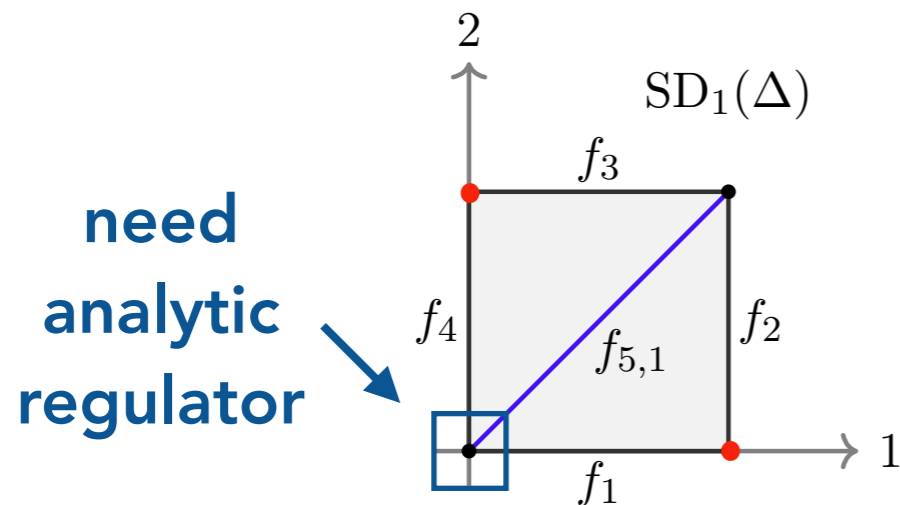

If $f \in F^{\text{int}}$ have $a_f = 0$ need analytic regulators $\boldsymbol{\nu} \rightarrow \boldsymbol{\nu} + \boldsymbol{\delta}\boldsymbol{\nu}$

Heinrich, Jahn, SJ, Kerner, Langer, Magerya, Pöldaru, Schlenk, Villa 21; Schlenk 16

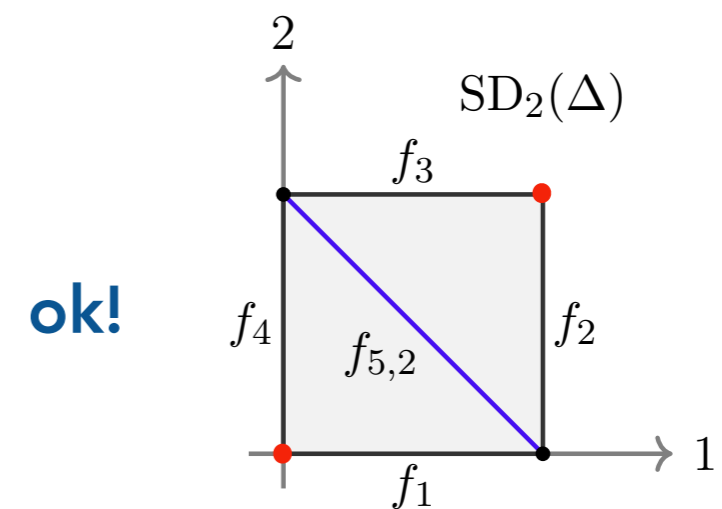

Additional Regulators (II)

Toy Example:

$$P_1(x, \lambda) = 1 + \lambda x_1 + x_1 x_2 + \lambda x_2$$

$$P_2(x, \lambda) = \lambda + x_1 + \lambda x_1 x_2 + x_2$$

pySecDec can find the constraints on the analytic regulators for you

`extra_regulator_constraints()`:

$$v_2 - v_4 \neq 0, \quad v_1 - v_3 \neq 0$$

`suggested_extra_regulator_exponent()`:

$$\{\delta v_1, \delta v_2, \delta v_3, \delta v_4\} = \{0, 0, \eta, -\eta\}$$

Small m expansion

Lee-Pomeransky and MoR

Building Bridges: LP \leftrightarrow Propagator Scaling

Region vectors in momentum space and Lee-Pomeransky space are related, we can see this using Schwinger parameters \tilde{x}_e

$$\frac{1}{D_n^{\nu_e}} = \frac{1}{\Gamma(\nu_e)} \int_0^\infty \frac{d\tilde{x}_e}{\tilde{x}_e} \tilde{x}_e^{\nu_e} e^{-\tilde{x}_e D_e}, \text{ with } x_e \propto \tilde{x}_e$$

$$(D_1^{-1}, \dots, D_N^{-1}) \sim (\tilde{x}_1, \dots, \tilde{x}_N) \sim (x_1, \dots, x_N)$$

Example: 1-loop form factor

Hard : $(D_1^{-1}, D_2^{-1}, D_3^{-1}) \sim (\lambda^0, \lambda^0, \lambda^0), \quad (x_1, x_2, x_3) \sim (\lambda^0, \lambda^0, \lambda^0)$

Collinear to p_1 : $(D_1^{-1}, D_2^{-1}, D_3^{-1}) \sim (\lambda^{-1}, \lambda^0, \lambda^{-1}), \quad (x_1, x_2, x_3) \sim (\lambda^{-1}, \lambda^0, \lambda^{-1})$

Collinear to p_2 : $(D_1^{-1}, D_2^{-1}, D_3^{-1}) \sim (\lambda^0, \lambda^{-1}, \lambda^{-1}), \quad (x_1, x_2, x_3) \sim (\lambda^0, \lambda^{-1}, \lambda^{-1})$

Soft : $(D_1^{-1}, D_2^{-1}, D_3^{-1}) \sim (\lambda^{-1}, \lambda^{-1}, \lambda^{-2}), \quad (x_1, x_2, x_3) \sim (\lambda^{-1}, \lambda^{-1}, \lambda^{-2})$

Can connect the regions in mom. space with those we determine geometrically

Next step: automatically find (Sudakov decomposed) loop momentum scalings compatible with region vectors [WIP w/ Yannick Ulrich](#)

Building Bridges: Landau \leftrightarrow Regions

The **Landau equations** give the necessary conditions for an integral to diverge

$$1) \quad \alpha_e l_e^2(k, p, q) = 0 \quad \forall e \in G$$

$$2) \quad \frac{\partial}{\partial k_a^\mu} \mathcal{D}(k, p, q; \alpha) = \frac{\partial}{\partial k_a^\mu} \sum_{e \in G} \alpha_e (-l_e^2(k, p, q) - i\varepsilon) = 0 \quad \forall a \in \{1, \dots, L\}$$

Solutions are *pinched surfaces* of the integral where IR divergences may arise

Idea is to explore the *neighbourhood of a pinched surface*, defined by

$$1) \quad \alpha_e l_e^2(k, p, q) \sim \lambda^p \quad \forall e \in G, \quad \text{with } p \in \{1, 2\}$$

$$2) \quad \frac{\partial}{\partial k_a^\mu} \mathcal{D}(k, p, q; \alpha) \lesssim \lambda^{1/2} \quad \forall a \in \{1, \dots, L\}$$

with the goal of further understanding the connection between

Solutions of the Landau equations \leftrightarrow Regions

Method of Regions (Details/Examples)

Geometric Method

In Feynman parameter space, there is a **geometric method** for finding regions

Pak, Smirnov 10

Each region will be defined by a **region vector** $\mathbf{v} = (v_1, \dots, v_N; 1)$, in each region we will perform a change of variables $x_i \rightarrow \lambda^{v_i} x_i$ and series expand about $\lambda = 0$

Let us start by considering some polynomial

$$P(\mathbf{x}, \lambda) = \sum_{i=1}^m c_i x_1^{r_{i,1}} \cdots x_N^{r_{i,N}} \lambda^{r_{i,N+1}}$$

c_i - non-negative coefficients

x_i - integration variables

λ - small parameter

$\mathbf{r}_i = (r_{i,1}, \dots, r_{i,N+1}) \in \mathbb{N}^{N+1}$ - exponent vectors

Geometric Method

Ignoring, for now, the coefficients c_i we can introduce a simple but useful picture for such polynomials:

- For each variable x_i or λ draw an orthogonal axis
- For each monomial, draw a dot at position \mathbf{r}_i

Example: $P(x, \lambda) = \lambda + x + x^2$ has exponent vectors
 $\mathbf{r}_1 = (0,1)$, $\mathbf{r}_2 = (1,0)$, $\mathbf{r}_3 = (2,0)$

Geometric Method

We may define a **Newton polytope** of the polynomial, this is the convex hull of the exponent vectors:

$$\Delta = \text{convHull}(\mathbf{r}_1, \mathbf{r}_2, \dots) = \left\{ \sum_j \alpha_j \mathbf{r}_j \mid \alpha_j \geq 0 \wedge \sum_j \alpha_j = 1 \right\}$$

Example: $P(x, \lambda) = \lambda + x + x^2$ has exponent vectors

$$\mathbf{r}_1 = (0, 1), \mathbf{r}_2 = (1, 0), \mathbf{r}_3 = (2, 0)$$

Geometric Method

Alternatively, this polytope can also be described as the intersection of half spaces:

$$\Delta = \bigcap_{f \in F} \left\{ \mathbf{m} \in \mathbb{R}^{N+1} \mid \langle \mathbf{m}, \mathbf{v}_f \rangle + a_f \geq 0 \right\}$$

F - set of polytope facets, $a_f \in \mathbb{Z}$

\mathbf{v}_f - inward-pointing normal vectors for each facet (co-dimension 1 face)

Several public tools exist for computing Newton polytopes/convex hulls and their representation in terms of facets exist, e.g. **Normaliz** and **Qhull**

Geometric Method

Next, let us define a vector \mathbf{u} such that $x_i = \lambda^{u_i}$ with $u_{N+1} = 1$ for each point \mathbf{x} in the integration domain, we can write:

$$P(\mathbf{u}, \lambda) = \sum_{i=1}^m c_i \lambda^{\langle \mathbf{r}_i, \mathbf{u} \rangle}$$

Since $\lambda \ll 1$, the largest term in the polynomial has the smallest $\langle \mathbf{r}_i, \mathbf{u} \rangle$

Note that we can have several points with the same projection on \mathbf{u} , i.e. we can have several largest terms

Example: $P(x, \lambda) = \lambda + x + x^2$ with $\mathbf{u} = (3, 1)$ gives $P(\mathbf{u}, \lambda) = \lambda + \lambda^3 + \lambda^6$

Geometric Method

Next, let us define a vector \mathbf{u} such that $x_i = \lambda^{u_i}$ with $u_{N+1} = 1$ for each point \mathbf{x} in the integration domain, we can write:

$$P(\mathbf{u}, \lambda) = \sum_{i=1}^m c_i \lambda^{\langle \mathbf{r}_i, \mathbf{u} \rangle}$$

Since $\lambda \ll 1$, the largest term in the polynomial has the smallest $\langle \mathbf{r}_i, \mathbf{u} \rangle$

Note that we can have several points with the same projection on \mathbf{u} , i.e. we can have several largest terms

Example: $P(x, \lambda) = \lambda + x + x^2$ with $\mathbf{u} = (1, 1)$ gives $P(\mathbf{u}, \lambda) = \lambda + \lambda + \lambda^2$

Expanding Regions

Rewrite our polynomial as: $P(\mathbf{x}) = Q(\mathbf{x}) + R(\mathbf{x})$

With $Q(\mathbf{x})$ defined such that it contains all of the lowest order terms in λ

The binomial expansion of

$$P(\mathbf{x})^m = Q(\mathbf{x})^m \left(1 + \frac{R(\mathbf{x})}{Q(\mathbf{x})} \right)^m \text{ converges for } \mathbf{x} = \lambda^{\mathbf{u}} \text{ if } R(\mathbf{x})/Q(\mathbf{x}) < 1$$

Some observations:

- An expansion with region vector \mathbf{v} converges at a point \mathbf{u} if the terms with minimum $\langle \mathbf{r}_i, \mathbf{u} \rangle$ are contained in the terms with minimum $\langle \mathbf{r}_i, \mathbf{v} \rangle$
- For any \mathbf{u} the vertices with the smallest $\langle \mathbf{r}_i, \mathbf{u} \rangle$ must be part of some facet F
- Since $u_{N+1} > 0$, the lowest order terms for any \mathbf{u} must lie on a facet whose inwards pointing normal vector has a positive $(N + 1)$ -th component, let us call the set of such facets F^+ or lower facets

Claim: regions are defined by vectors normal to the facets in F^+ , the integrand in each region consists of the monomials lying on the facet

Scaleless Integrals

Scaleless integrals seem to play quite an interesting role

Momentum space

In dimensional regularisation, **scaleless integrals are 0**

$$I(\{k_i\}_a, \{ck_i\}_b) = c^q I(\{k_i\}) \implies I(\{k_i\}) = 0, \quad \{k_i\} = \{k_i\}_a \cup \{k_i\}_b$$

Where $c \neq 1$ and $q \neq 0$ is some scaling dimension

Feynman parameter space

$$(\mathcal{U}\mathcal{F})(c^{\mathbf{u}}\mathbf{x}) = c^q (\mathcal{U}\mathcal{F})(\mathbf{x}), \quad \mathbf{u} \neq n\mathbf{1}, \quad n \in \mathbb{R}$$

Geometrical view

For Δ built from $\mathcal{U} + \mathcal{F}$

$\dim(\Delta) = \dim(\mathbf{x}) \iff I$ scaleful

$\dim(\Delta) < \dim(\mathbf{x}) \iff I$ scaleless

Important consequences:

Faces of co-dimension > 1 are scaleless
“Region” vectors not normal to a facet
give scaleless integrals

Overlap contributions i.e. rescaling by
two region vectors, are scaleless

Triangle Example

Consider the on-shell limit $p_1^2 \sim p_2^2 \sim \lambda q_1^2$ for $\lambda \rightarrow 0$

$$I = i\pi^{D/2} \mu^{4-D} \int d^D k \frac{1}{(k+p_1)^2 (k+p_2)^2 (k^2)}$$

$$p_1 = (p_1^+, p_1^-, p_1^\perp) \sim Q(\lambda, 1, \lambda^{\frac{1}{2}})$$

$$p_2 \sim Q(1, \lambda, \lambda^{\frac{1}{2}})$$

1) Split integrand up into regions

Hard : $k_H^\mu \sim (1, 1, 1) Q$

Collinear to p_1 : $k_{J_1}^\mu \sim (\lambda, 1, \lambda^{\frac{1}{2}}) Q$

Collinear to p_2 : $k_{J_2}^\mu \sim (1, \lambda, \lambda^{\frac{1}{2}}) Q$

Soft : $k_S^\mu \sim (\lambda, \lambda, \lambda) Q$

2) Series expand each region in λ

$$I_H = i\pi^{d/2} \mu^{4-D} \int d^D k \frac{1}{(k^2 + 2k^+ \cdot p_1^-)(k^2 + 2k^- \cdot p_2^+)(k^2)}$$

$$I_{C_1} = i\pi^{d/2} \mu^{4-D} \int d^D k \frac{1}{(k+p_1)^2 (2k^- \cdot p_2^+)(k^2)}$$

$$I_{C_2} = i\pi^{d/2} \mu^{4-D} \int d^D k \frac{1}{(2k^- \cdot p_1^+)(k+p_2)^2 (k^2)}$$

$$I_S = i\pi^{d/2} \mu^{4-D} \int d^D k \frac{1}{(2k^+ \cdot p_1^- + p_1^2)(2k^- \cdot p_2^+ + p_2^2)(k^2)}$$

Analysis follows:

Becher, Broggio, Ferroglia 14

Triangle Example

3-5) Integrate each expansion over the whole integration domain, discard scaleless, sum

$$\begin{aligned}
 I_H &= \frac{\Gamma(1 + \epsilon)}{Q^2} \left(\frac{1}{\epsilon^2} + \frac{1}{\epsilon} \ln \frac{\mu^2}{Q^2} + \frac{1}{2} \ln^2 \frac{\mu^2}{Q^2} - \frac{\pi^2}{6} + \mathcal{O}(\lambda) \right) \\
 I_{C_1} &= \frac{\Gamma(1 + \epsilon)}{Q^2} \left(-\frac{1}{\epsilon^2} - \frac{1}{\epsilon} \ln \frac{\mu^2}{P_1^2} - \frac{1}{2} \ln^2 \frac{\mu^2}{P_1^2} + \frac{\pi^2}{6} + \mathcal{O}(\lambda) \right) \\
 I_{C_2} &= \frac{\Gamma(1 + \epsilon)}{Q^2} \left(-\frac{1}{\epsilon^2} - \frac{1}{\epsilon} \ln \frac{\mu^2}{P_2^2} - \frac{1}{2} \ln^2 \frac{\mu^2}{P_2^2} + \frac{\pi^2}{6} + \mathcal{O}(\lambda) \right) \\
 I_S &= \frac{\Gamma(1 + \epsilon)}{Q^2} \left(\frac{1}{\epsilon^2} + \frac{1}{\epsilon} \ln \frac{\mu^2 Q^2}{P_2^2 P_1^2} + \frac{1}{2} \ln^2 \frac{\mu^2 Q^2}{P_2^2 P_1^2} + \frac{\pi^2}{6} + \mathcal{O}(\lambda) \right) \\
 I &= I_H + I_{C_1} + I_{C_2} + I_S = \frac{1}{Q^2} \left(\ln \frac{Q^2}{P_2^2} \ln \frac{Q^2}{P_1^2} + \frac{\pi^2}{3} + \mathcal{O}(\lambda) \right)
 \end{aligned}$$

This reproduces the expected result, but why does this work (and does it always)?

- 1) How did we **find all the regions**?
- 2) Did we not **double-count** when integrating over the whole domain ?

pySecDec: EBR Box Example

Example: 1-loop massive box expanded for small $m_t^2 \ll s, |t|$

Requires the use of analytic regulators

Can regulate spurious singularities by adjusting propagators powers

$$G_4 = \mu^{2\epsilon} \int_{-\infty}^{\infty} \frac{d^D k}{i\pi^{D/2}} \frac{1}{[k^2 - m_t^2]^{\delta_1} [(k + p_1)^2 - m_t^2]^{\delta_2} [(k + p_1 + p_2)^2 - m_t^2]^{\delta_3} [(k - p_4)^2 - m_t^2]^{\delta_4}}$$

Can keep $\delta_1, \dots, \delta_4$ symbolic or $\delta_1 = 1 + n_1/2, \delta_2 = 1 + n_1/3, \dots$ and take $n_1 \rightarrow 0^+$

Output region vectors:

$$\mathbf{v}_1 = (0, 0, 0, 0, 1)$$

$$\mathbf{v}_2 = (-1, -1, 0, 0, 1)$$

$$\mathbf{v}_3 = (0, 0, -1, -1, 1)$$

$$\mathbf{v}_4 = (-1, 0, 0, -1, 1)$$

$$\mathbf{v}_5 = (0, -1, -1, 0, 1)$$

Result: $s = 4.0, t = -2.82843, m_t^2 = 0.1, m_h^2 = 0$

$$I = -1.30718 \pm 2.7 \cdot 10^{-6} + (1.85618 \pm 3.0 \cdot 10^{-6}) i$$

$$+ \mathcal{O} \left(\epsilon, n_1, \frac{m_t^2}{s}, \frac{m_t^2}{t} \right)$$

Transform the expression for the full integral:

$$\begin{aligned}
 F &= \int_{k \in D_h} Dk I + \int_{k \in D_s} Dk I = \sum_i \int_{k \in D_h} Dk T_i^{(h)} I + \sum_j \int_{k \in D_s} Dk T_j^{(s)} I \\
 &= \sum_i \left(\int_{k \in \mathbb{R}^d} Dk T_i^{(h)} I - \sum_j \int_{k \in D_s} Dk T_j^{(s)} T_i^{(h)} I \right) + \sum_j \left(\int_{k \in \mathbb{R}^d} Dk T_j^{(s)} I - \sum_i \int_{k \in D_h} Dk T_i^{(h)} T_j^{(s)} I \right)
 \end{aligned}$$

The expansions commute: $T_i^{(h)} T_j^{(s)} I = T_j^{(s)} T_i^{(h)} I \equiv T_{i,j}^{(h,s)} I$

$$\Rightarrow \text{Identity: } F = \underbrace{\sum_i \int Dk T_i^{(h)} I}_{F^{(h)}} + \underbrace{\sum_j \int Dk T_j^{(s)} I}_{F^{(s)}} - \underbrace{\sum_{i,j} \int Dk T_{i,j}^{(h,s)} I}_{F^{(h,s)}}$$

All terms are integrated over the whole integration domain \mathbb{R}^d as prescribed for the expansion by regions \Rightarrow location of boundary Λ between D_h, D_s is irrelevant.

The general formalism (details)

Identities as in the examples are **generally valid**, under some conditions.

Consider

- a (multiple) integral $F = \int_D k I$ over the domain D (e.g. $D = \mathbb{R}^d$),
- a set of N regions $R = \{x_1, \dots, x_N\}$,
- for each region $x \in R$ an expansion $T^{(x)} = \sum_j T_j^{(x)}$ which converges absolutely in the domain $D_x \subset D$.

Conditions

- $\bigcup_{x \in R} D_x = D$ $[D_x \cap D_{x'} = \emptyset \ \forall x \neq x']$.
- Some of the **expansions commute** with each other.
Let $R_c = \{x_1, \dots, x_{N_c}\}$ and $R_{nc} = \{x_{N_c+1}, \dots, x_N\}$ with $1 \leq N_c \leq N$.
Then: $T^{(x)} T^{(x')} = T^{(x')} T^{(x)} \equiv T^{(x, x')} \ \forall x \in R_c, x' \in R$.
- Every pair of non-commuting expansions is invariant under some expansion from R_c :
 $\forall x'_1, x'_2 \in R_{nc}, x'_1 \neq x'_2, \exists x \in R_c : T^{(x)} T^{(x'_2)} T^{(x'_1)} = T^{(x'_2)} T^{(x'_1)}$.
- \exists **regularization** for singularities, e.g. dimensional (+ analytic) regularization.
 \hookrightarrow All expanded integrals and series expansions in the formalism are well-defined.

The general formalism (2)

Under these conditions, the following **identity** holds: $[F^{(x,\dots)} \equiv \sum_{j,\dots} \int \text{D}k T_{j,\dots}^{(x,\dots)} I]$

$$F = \sum_{x \in R} F^{(x)} - \sum_{\{x'_1, x'_2\} \subset R}^{\langle R_c + 1 \rangle} F^{(x'_1, x'_2)} + \dots - (-1)^n \sum_{\{x'_1, \dots, x'_n\} \subset R}^{\langle R_c + 1 \rangle} F^{(x'_1, \dots, x'_n)} + \dots + (-1)^{N_c} \sum_{x' \in R_{nc}} F^{(x', x_1, \dots, x_{N_c})}$$

where the sums run over subsets $\{x'_1, \dots\}$ containing at most one region from R_{nc} .

Comments

- This identity is **exact** when the expansions are summed to all orders. ✓
Leading-order approximation for $F \rightsquigarrow$ dropping higher-order terms.
- It is **independent of the regularization** (dim. reg., analytic reg., cut-off, infinitesimal masses/off-shellness, ...) as long as all individual terms are well-defined.
- Usually regions & regularization are chosen such that **multiple expansions** $F^{(x'_1, \dots, x'_n)}$ ($n \geq 2$) are **scaleless** and vanish.
[✓ if each $F_0^{(x)}$ is a *homogeneous* function of the expansion parameter with *unique scaling*.]
- If $\exists F^{(x'_1, x'_2, \dots)} \neq 0 \rightsquigarrow$ relevant **overlap contributions** (\rightarrow “zero-bin subtractions”).
They appear e.g. when avoiding analytic regularization in SCET. e.g. Manohar, Stewart '06;
Chiu, Fuhrer, Hoang, Kelley, Manohar '09; ...
