

No- π schemes for multi-coupling theories

Monday 15 April 2024 17:30 (30 minutes)

We show that even ζ -functions may be removed from the β -functions of general multi-coupling theories up to high loop order by means of coupling redefinitions. For theories whose β -function is determined by the anomalous dimensions of the fields, such as supersymmetric theories, this corresponds to a renormalisation scheme change to a momentum subtraction scheme.
