

HotQCD observations/thoughts/needs

- *Container environment very convenient, easy to use, ran smoothly.*
- *Idea: if a container doesn't work for a user, is it reasonable to give them access to a system where it does work?*
 - *computer centers usually don't allow for docker but sometimes allow for apptainer (JUDAC@JSC)*
- *Confusion about some QCDml entries should be cleared up (e.g. David is not in contact with anyone who knows what 'normalization' means.)*
 - *need more documentation*
 - *recover old glossary, find new repository for them*
 - *possibility to add more observables*
- *Idea: Have an allowed/standardized "UNKNOWN" tag for such cases?*
- *As is already known/being worked on: it's nice to be able to save many configs in one lime file and nice to save compressed configurations.*
 - *extension to the the schema which is already discussed in the Working groups*
- *Would be nice to have more tools streamlining markup and placement in SE, FC, and MDC. The XML webpage was nice. Another good starting point could be [createQCDml](#), on GitHub under that link.*

In order to start uploading:

- *Need new project in the MDC (easy)*
- *Need storage space (difficult, political problem)*
