Neural Network Analysis Recurrent Neural Networks Analysis

Problem Description

- Task: Predict the vertical beam size of the electron beam
- Why?
 - Derive vertical beam size from device settings
 - Long term: Adjust noise generator for constant beamsize ⇒ minimize impact from one user to another
 - Preparation for BESSY III: round beam

Figure 3: Beam image taken by a pinhole camera. Picture provided by the Helmholtz Zentrum Berlin.

Model setting

- How is the data saved?
 - time series data, i.e. time points t_1, \ldots, t_N exist
 - 152 different BESSY II parameters, e.g. undulator settings, vacuum statuses, steerer settings
 - vertical beam size is given as real number
- In our case typically $t_i t_{i-1} \approx \frac{1}{4}$ second and $N > 1.5 * 10^6$ per week
- In the following we have split the dataset $\mathcal D$ into $\mathcal D_{\textit{train}}$ and $\mathcal D_{\textit{test}}$

Performance Analysis

- Results look promising, only slight offset
 ⇒ could be solved by more data
- In some sections visible: Time dependence
- Time dependence result by thermal effects

< ∃⇒

Long short-term memory (LSTM)

- Special RNN, enabling long-term dependencies
- Fundamental difference:
 - multiple input values are considered,
 - i.e. y_t depends on $x_t, x_{t-1}, \ldots, x_{t-m}$
 - allows information to flow over several blocks
 - using a cell state

Introduction Intuition Programming Results

Problem Description

- Task: Find optimal NLK settings
- Steps:
 - Chose steerer settings leading to NLK
 - Chose activation round and strength of NLK
- Goal:
 - Improve injection efficiency
 - Minimize impact on stored beam

Figure 8: Kicker field strength plot.

(日)

Model setting

- In each round from $0, \ldots, 1000$:
 - Input: x, px information of electrons
 - Chose if we want to activate NLK
 - Chose strength of NLK
- NLK can only be activated once
- Goal: Maximize number of electrons that survive 1000 rounds
- When is a electron lost?
 - If it hits the septum sheet, that lies at 15mm
- Modelable by Markov Decision Process

・ロト ・御 ト ・ ヨ ト ・ ヨ ト ・ ヨ ・

Model setting

- In each round from $0, \ldots, 1000$:
 - Input: x, px information of electrons
 - Chose if we want to activate NLK
 - Chose strength of NLK
- NLK can only be activated once

Definition (Markov Decision Process)

A Markov Decision Process is a tuple ($\mathcal{S}, \mathcal{A}, \mathcal{P}, \mathcal{R}, \gamma$), where

- S state space (electron information + NLK activated?)
- $\mathcal A$ action space (NLK strength $\in [-1,1]$)
- \mathcal{P} probability transition, with $\mathcal{P}_{a}(s, s') = \mathbb{P}(S_{t+1} = s' | S_t = s, A_t = a)$
- $\mathcal R$ reward function and γ discount factor ($\mathcal R$ portion survived)

Introduction Intuition Programming Results

Intuition

Figure 9: Figure showing the septum sheet at 15mm.

- Injected electrons survive multiple rounds without a kick
- But eventually crash into the septum sheet

Figure 10: Example of phase space. Blue first round, red second, green third and yellow fourth round. Modified from Lin Liu et al. [2]

Introduction Intuition Programming Results

Without Kicker (deterministic model)

Number of rounds electrons survive without kicker

Alexander Schütt

Introduction Intuition Programming Results

How to use the Kicker

- Kicker only changes flight direction
- Kicker strength scales magnetic field strength
- How to kick optimally?
 - x value of electron must be between -15mm and 15mm
 - Kicker strength must be chosen, s.t. new drift is equal 0
- Problem: If x value of electron is too close to 0

Figure 11: Kicker field strength plot.

Introduction Intuition Programming Results

Programming Results

Total number of possibilities

Introduction Intuition Programming Results

Programming Results

- We can see:
 - Using only Round 0 is not optimal
 - Lot of opportunities
- Left to do:
 - Find optimal NLK settings for distribution of electrons
 - Stochastic model
 - Find the optimal steerer settings before the NLK

Summary

What have we seen?

- Vertical beam size prediction
 - Motivated choice of LSTMs
 - Compared performance for vertical beam size prediction
 - Analysed how different parameters change the beam size

◆□ → ◆□ → ◆ 三 → ◆ 三 → ○ へ ○ 34/35

- Nonlinear Kicker Injection
 - 4 kicker bump and NLK injection
 - Advantages using NLK injection
 - Intuition behind the NLK functionality
 - First programming results
