Outline

Transverse-momentum dependent
distributions

Why? What? How?

Why going to next-to-leading power?

Why we need TMD distributions?

Allow for more information on the internal structure of the proton

Spin-orbit correlations between proton spin and parton's transverse momentum

Sivers distribution

They enter the description of measured physical processes

Their scaling properties are related to the structure of QCD vacuum

Drell-Yan

proton, proton \rightarrow lepton, lepton, X

SIDIS

proton, lepton \rightarrow lepton, H, X

Can be accessed partially from lattice calculations

Why we need TMD distributions?

The language

Hadronic tensor

$$H^{\mu\nu} = \sum_X \langle p_1, p_2 | J^\mu(y) | X \rangle \langle X | J^\nu(0) | p_1, p_2 \rangle$$

TMD distributions

Leptonic tensor $L^{\mu\nu}$

Leading-power
factorization

What are TMD distributions?

$$\text{Tr} [\Gamma \Phi(z_2, z_1, b)] = \langle P | \bar{q}(z_2 n + b) \Gamma q(z_1 n + b) | P \rangle$$

$$\Phi(x, b) = \int \frac{dz}{\pi} e^{-i2xz(Pn)} \Phi(z, -z, b)$$

A bit more formally

$$\text{Tr} [\Phi(x, b) \Gamma]$$

$$\Gamma \in \{\gamma^+, \gamma^+ \gamma_5, i\sigma^{\alpha+} \gamma_5\}$$

	U	H	T
U	f_1		h_1^\perp
L		g_1	h_{1L}^\perp
T	f_{1T}^\perp	g_{1T}	h_1, h_{1T}^\perp

Well-defined (they have close evolution equations)

Two-scale problem: UV and rapidity

$$\zeta \frac{\partial}{\partial \zeta} \Phi(x, b) = -\mathcal{D}(b) \Phi(x, b)$$

(For all other possible choices of Gamma this is not true anymore)

A bit more formally

Is this the end of the story?

The measurement has to be differential in a 'transverse' variable

For DY the transverse component
of the virtual photon
respect to the proton-proton plane

For SIDIS the transverse component
of the produced hadron
respect to the proton-photon plane

Need to select the
appropriate kinematic region

Fixed order

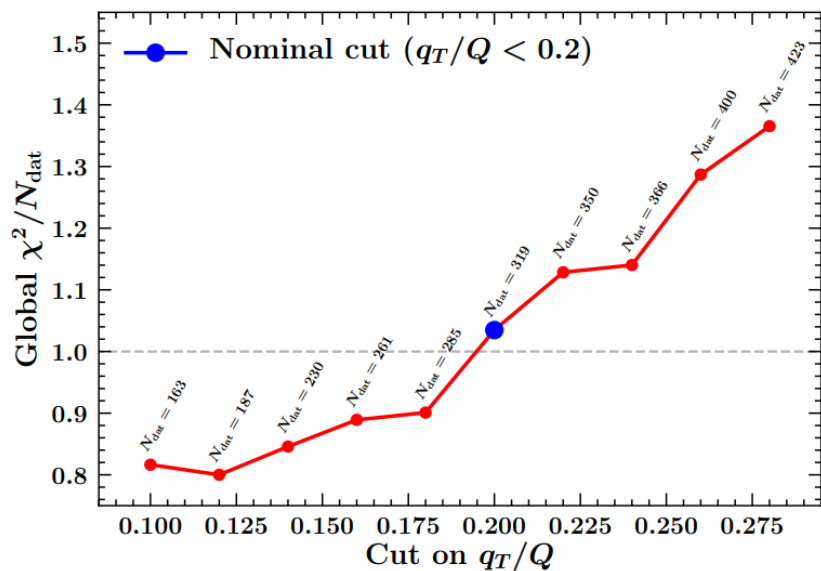

Non-perturbative TMD

Resummation

Next-to-leading power

No

$$\delta = \frac{q_T}{Q} \lesssim 0.25$$

Moos et al: 2305.07473

MAP-collaboration: JHEP 10 (2022) 127

Effort to push beyond leading-power

At leading-power

Massless

$$h \quad P \sim 0$$

$$\frac{q_T}{Q}, \frac{k_T}{Q} \sim 0$$

Beyond LP, state of the art:

Massless

$$h \quad P \sim 0 \quad \frac{q_T}{Q} \sim 0$$

$$\frac{k_T}{Q}$$

Complete tower

Vladimirov, 2307.13054
