## Generation of ultrashort pulses in the Hard X-Ray range at the European XFEL

*Wednesday 28 August 2024 16:35 (20 minutes)*

Despite significant advancements in generating attosecond pulses in the extreme ultraviolet and soft X-ray regimes, achieving high-power attosecond pulses at Ångstrom wavelengths has remained a considerable challenge. The generation of intense attosecond hard X-ray pulses is pivotal for probing the structural and electronic dynamics of matter with unprecedented precision. Recently, we proposed a self-chirping mode to generate terawatt-attosecond pulses at Ångstrom wavelengths using X-ray free-electron lasers (FEL). This presentation will detail our experiments at the European XFEL, showcasing the successful production of stable high-power single-mode hard X-ray FEL pulses.
