Contribution ID: 1051

Type: Invited talk

Status of the EuXFEL

Wednesday 28 August 2024 11:00 (20 minutes)

Hard X-ray Free Electron (XFEL) lasers produce extremely intense and ultra-short X-ray pulses, perfect for investigating the structure and dynamics of matter at atomic length and time scales. Operating for over a decade, these lasers have demonstrated a wide range of applications in physics, chemistry, materials science, and structural biology.

The European XFEL, one of the latest large-scale research infrastructures in Europe, has recently celebrated five years of successful user operations. The facility features a 3.5 km long tunnel, including a 2 km long superconducting accelerator, stretching from DESY in Hamburg to Schenefeld in Schleswig-Holstein, where the experimental hall houses seven instruments. These instruments offer a broad range of experimental capabilities.

Since beginning operations, numerous exciting user experiments have been conducted in fields such as physics, chemistry, bio-crystallography, and material science. In my talk, I will present the main principles of the science performed at the European XFEL, with a focus on high energy density science. I will also provide examples from recent experiments in various scientific areas.

I plan to submit also conference proceedings

No

Primary author: FEURER, Thomas (Eur.XFEL (European XFEL))

Presenter: FEURER, Thomas (Eur.XFEL (European XFEL))

Session Classification: Mikrosymposium 6/1: FELs: New facilities and Opportunitites

Track Classification: 6. FELs: New facilities and opportunities
