2 x 0.5/fb
1992 – 2007

• theory

- little higgs
- unparticles

Tevatron Run II Preliminary

$$h, H, A \rightarrow \tau\tau$$

$\mu = +200 \text{ GeV}, M_2 = 200 \text{ GeV}, m_g = 0.8 M_{\text{SUSY}}$
 $M_{\text{SUSY}} = 1 \text{ TeV}, X_t = \sqrt{6} M_{\text{SUSY}} (m_h^{\text{max}}); M_{\text{SUSY}} = 2 \text{ TeV}, X_t = 0 \text{ (no-mixing)}$

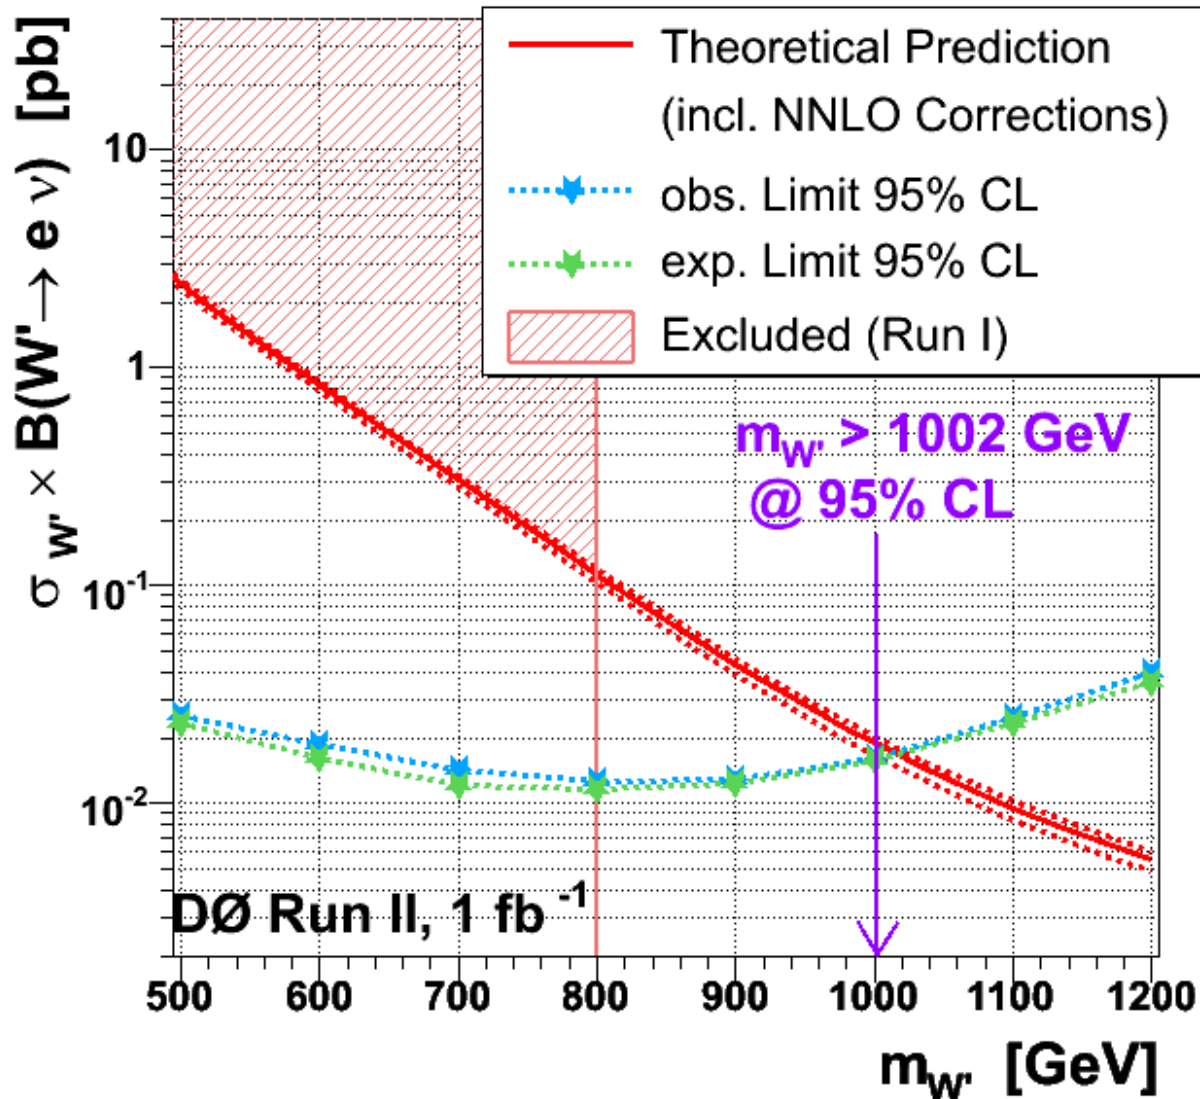

CDF:
slight excess

D0:
Nothing

Sensitivity:
 $\tan \beta \sim 50$

world Tevatron search new vector bosons

first direct
search limit
> 1 TeV

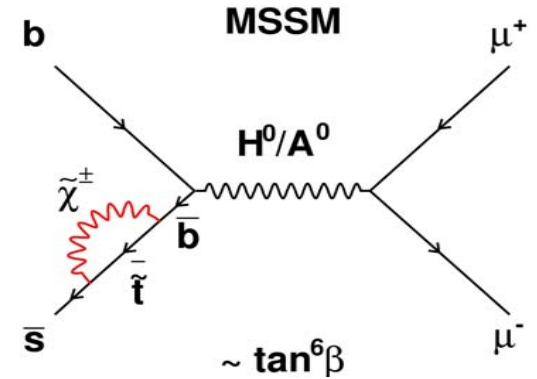

D0: $W' \rightarrow e \nu, L = 1 \text{ fb}^{-1}$

$m_{W'} > 1002 \text{ GeV}$ @ 95% CL

mSUGRA at $\tan\beta = 50$

Arnowitz, Dutta, et al., PLB 538 (2002) 121

CDF (prel.):

$BR(B_s \rightarrow \mu\mu) < 5.8 \times 10^{-8}$

„hierarchy problem“

$$\Delta m_H^2 = \frac{|\lambda_f|^2}{16\pi^2} [-2\Lambda_{UV}^2 + 6m_f^2 \ln(\Lambda_{UV}/m_f) + \dots] \longrightarrow \text{HUGE}$$

possible solutions:

a) Add SUSY partner loops: same coupling, negative sign !

b) „little higgs“ theories (Arkani-Hamed et al, 2001)

higgs = (pseudo) goldstone boson (new global symmetry)

new fermions (bosons) to cancel fermion (boson) loops !!!

one light higgs, heavy new particles, no SUSY !

new heavy ($> \text{TeV}$) particles:

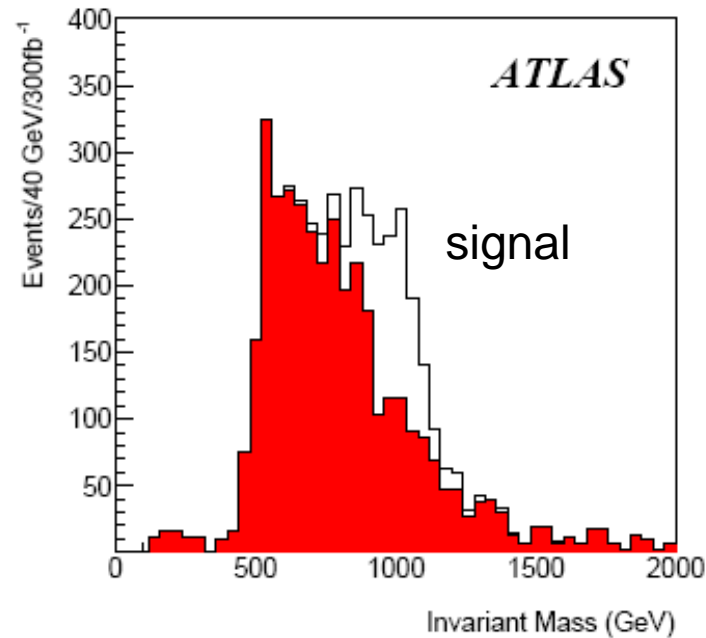

- vector bosons
- fermions, in particular top partner $t' = T$
- higgs scalars

- Top partner T :

⇒ leptons +
(b-) jets

LHC reach
~ 2 TeV

H. Georgi, Phys. Rev. Lett. 98, 221601 (2007):

Unparticle stuff with scale dimension d_U looks like a non-integral number d_U of invisible particles.

...sector interacting weakly with SM

...scale invariant, therefore no fixed particle mass ...

...fields scale with dimension d_U

...

See also J.J. Van der Bij and S. Dilcher, hep-ph/0707.1817 and references therein

unparticle signature : missing energy

unparticle signature at LHC: virtual contribution to Drell Yan

Figure 6: Drell-Yan dilepton mass distribution at the LHC with high luminosity assuming $\mu = 2$ TeV with $\Lambda = 1(2)$ TeV in the top(bottom) panel. The yellow histogram is the SM prediction while the red(green,blue,magenta,cyan) histograms corresponds to $d=1.1(1.3,1.5,1.7,1.9)$, respectively.

- Hamburg, Dec. 2007 (HGF)

working groups:

- **SUSY/BSM parameter determination and benchmarks**
(conveners [K. Desch](#) and [W. Porod](#))
- **SUSY/BSM tools** (conveners [W. de Boer](#) and [F. Krauss](#))
- **Model independent searches**
(conveners [P. Biallass](#) and [S. Caron](#))

convenors: Maria Spiropulu , Sarah Eno

working groups:

- WG1: Leptonic searches (SUSY) $e, \mu + X$
- WG2: Hadronic searches (SUSY) $jets + MET$
- WG3: HSCP and photonic searches (GMSB) $heavy\ stable$
 $charged\ particle$
- WG4: High Energy Pair Searches (U(1)-prime/ED/other)

convenors: Maria Spiropulu , Sarah Eno

working groups:

- WG1: Leptonic searches (SUSY) $e, \mu + X$
 $\tilde{\chi}_2 \rightarrow ee \tilde{\chi}_1$
- WG2: Hadronic searches (SUSY) $jets + MET$
 $\tilde{q} \rightarrow q \tilde{\chi}$
- WG3: HSCP and photonic searches (GMSB) $heavy\ stable$
 $\tilde{\tau}$ $\tilde{\chi} \rightarrow \tilde{G} \gamma$ $charged\ particle$
- WG4: High Energy Pair Searches (U(1)-prime/ED/other)
 $Z' \rightarrow \mu\mu$

HM =
High Mass

LM =
Low Mass

current global activities:

- „data“:

(pre-) CSA07: 150 million MC events

SUSY/BSM: ~ 70 samples (LM1, LM2,)

100k events each, simulated and reconstructed

⇒ skimming

- tools:

susy analyzer

„prototype of code to perform a physics analysis, mainly in view of SUSY searches“

susy tools

„SusyTools is an attempt to refactor [SusyAnalyzer](#) in a more "CMSSW framework"-like“

working groups:

- WG1: Leptonic searches (SUSY)
AC IB, AC IIIA, KA
- WG2: Hadronic searches (SUSY)
HH
- WG3: HSCP and photonic searches (GMSB)
HH ?
- WG4: High Energy Pair Searches (U(1)-prime/ED/other)
- Model independent searches
AC IIIA

SUMMARY

... hopefully some overlap ...
