DOIs minting at DESY – the way to go

“We have everything”

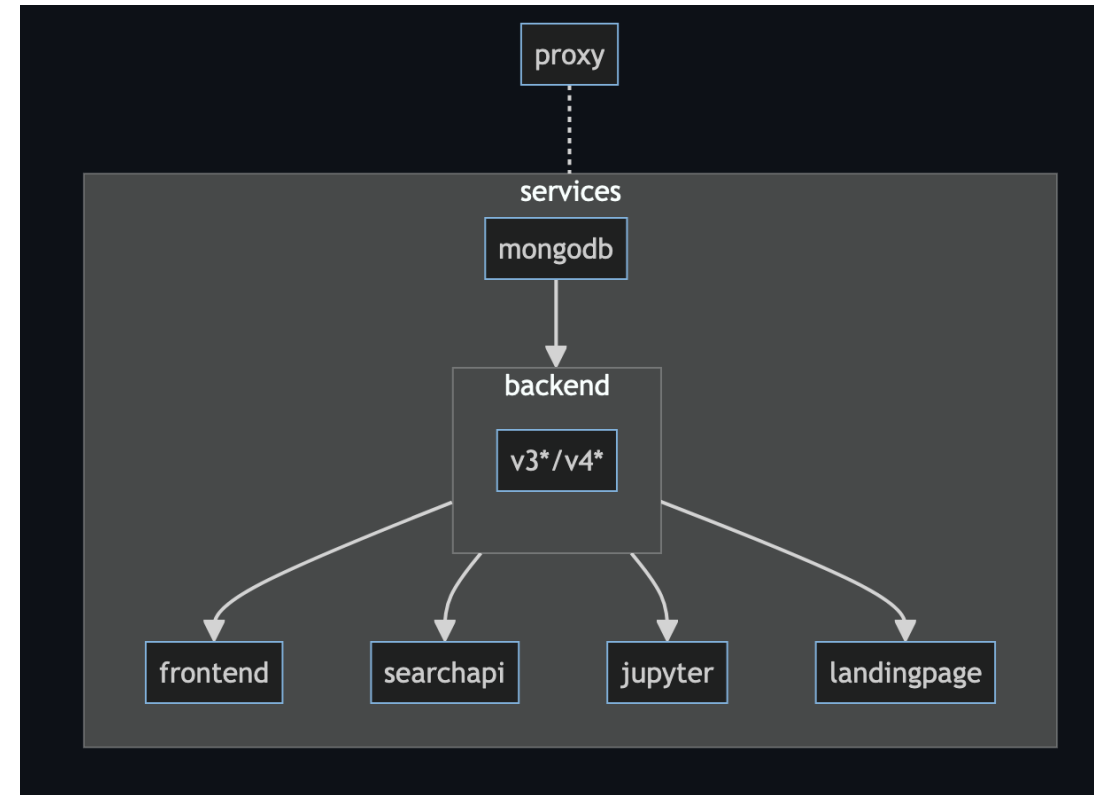

Indeed we have in theory all the necessary components, ie

- Code to provide LandingPageServer (specific frontend client).
- Standardised interface to backend, communication via DataCite APIs (roughly).
- Credentials from L to be able to request at DataCite DOIs for datasets produced at DESY.

However at a closer look it became clear that

- Out of the box, the code won't work (due to hardcoded connections).
- **scicatlive** has been just revived, ie. polished to work with the new backend: modular setup of all relevant services.

scicatlive dependencies

Work in progress

Some first steps

In **scicatlive** repository

- **Add SciCat LandingPage container #29 & #185:** Added necessary files to setup a new service in scicatlive calling the landing page code.

In **LandingPageServer** repository

- **Make landingpage configurable at run time #327** Currently, the configuration is hardcoded in the docker image because it's supplied to angular before the build. The docker image should be configurable at run time. *Carlo assigned it to me.*

Special THANKS go to Johannes Reppin (IT-InFa) and Carlo Minotti (PSI).

Thanks
