

Pulse-Resolved Fluorescence Reconstruction

Liu Tianchi, FS-TUX

Experimental set-up

Run overview

Outlines

- Preliminary data processing
 - masking
 - discretisation
- Fluorescence background reconstruction
 - absorption
 - detector efficiency
 - solid angle
 - poisson fit and correction
- Check on homogeneity
 - slope
 - standard deviation
- Parameter optimisation (CuSO₄ and BN thickness)
- Fluorescence yield

Masking

Discretisation & Calibration

- sample data logarithmic histogram
- maximum number of photons

Discretisation & Calibration

Geometry set-up

Line source absorption

light interacted in delta x: $e^{-\frac{x}{d_{9000}}} - e^{-\frac{x+\Delta x}{d_{9000}}} \approx -\frac{e^{-\frac{x}{d_{9000}}}}{d_{9000}} \cdot \Delta x$

factor of attenuation when leaving CuSO₄: $\exp\left(-\frac{d_{\text{CuSO}_4} - x}{d_{8048} \cdot \cos(\theta)}\right)$

integration and normalisation:
$$\frac{\int_0^{d_{\text{CuSO}_4}} \frac{d_{\text{CuSO}_4} \exp\left(-\frac{x}{d_{9000}}\right) \cdot \exp\left(-\frac{d_{\text{CuSO}_4} - x}{d_{8048} \cdot \cos(\theta)}\right)}{d_{9000}} dx}{\int_0^{d_{\text{CuSO}_4}} \frac{\exp\left(-\frac{x}{d_{9000}}\right)}{d_{9000}} dx}$$

Absorption map

Attenuation lengths

- CuSO₄.5H₂O_8048: 142.61 μm
- CuSO₄.5H₂O_9000: 51.60 μm
- BN_8048: 982 μm
- air_8048: 0.3252 m
- Cu_8048: 22.29 μm

Detector map

Solid angle map

Overall correction

$$\text{correction} = \frac{1}{\text{absorption} \times \text{detector} \times \text{solid angle}}$$

Poisson fit and reconstruction

- divide the detector pixels into **200 regions** based on correction map
- each region can be seen as approximately homogeneous
- Poisson fit in each region
- use fitted lambda instead of pixel values
- perform correction

Reconstruction result - $v_{\max}=\max$, $v_{\min}=0.1*\max$

Check on homogeneity

- tag 0

Check on homogeneity

Check on homogeneity

Fluorescence photon number

$$\sigma_{\text{Cu}} = 2.986 \times 10^{-6}$$

$$\sigma_{\text{H}} = 6.331 \times 10^{-13}$$

$$\sigma_{\text{S}} = 3.505 \times 10^{-7}$$

$$\sigma_{\text{O}} = 1.977 \times 10^{-8}$$

$$\text{ratio} = 0.84964$$

Parameter scan

Mean Corrected vs CuSO4 and BN Thickness

Mean Corrected vs CuSO4 and BN Thickness

Mean Corrected vs CuSO4 and BN Thickness

Normalized Standard Deviation vs CuSO4 and BN Thickness

Normalized Standard Deviation vs CuSO4 and BN Thickness

Normalized Standard Deviation vs CuSO4 and BN Thickness

Percentage Mean vs CuSO4 and BN Thickness

Percentage Mean vs CuSO4 and BN Thickness

Percentage Mean vs CuSO4 and BN Thickness

Fluorescence yield

- unexpected correlation
- mean yield 0.55007
- huge fluctuation overshadowing non-linear effect

Fluorescence yield

- no correlation
- smaller fluctuation
- needs to calibrate

Thank you for listening
