

IMCC and MuCol Annual Meeting

Cost and Power

C. Rossi – 14th May 2025

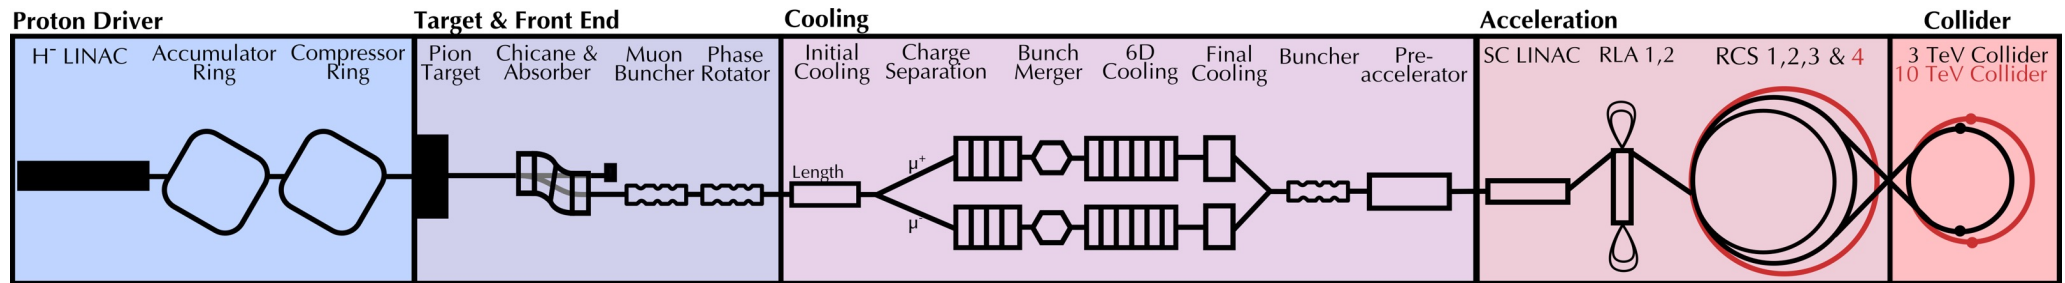

OUTLINE

- General approach to the costing of the Muon Collider Facility
- What is included and what is not
- Cost analysis
- Indications and limits from the first exercise
- Possible way to the next step

General Approach

- The estimate is presented in the form of a **cost range**
- The **CERN scenario** is first considered, to exploit the existing infrastructure: boundary conditions to the facility configurations.
 - The environmental impact is reduced;
 - A staging approach is still possible.
- The estimate is based on **main cost drivers only**, provided by experts and based on existing designs and on expected developments:
 - Magnets
 - RF
 - Cryogenics
 - Power converters
 - Civil engineering + extrapolated infrastructure

General Approach

Starting from the facility layout, a Project Breakdown Structure (PBS) was built

| PBS | | | | Class | Description |
|---------|---------|---------|---------|-------------|---------------|
| 1st lvl | 2nd lvl | 3rd lvl | 4th lvl | uncertainty | |
| 1.0.0 | | | | | Proton Driver |
| | 1.1.0 | | | 4 | SC Linac |
| | 1.2.0 | | | | Accumulator |
| | 1.3.0 | | | | Compressor |

Combines Class IV and Class V for overall uncertainty.

Configurations

| Parameter | Symbol | unit | Site independent | | CERN | |
|------------------------------|------------------------------------|--|--------------------|---------|---------|------------------------------|
| | | | Stage 1 | Stage 2 | Stage 1 | Stage 2 |
| Centre-of-mass energy | E_{cm} | TeV | 3 | 10 | 3.2 | 7.6 |
| Target integrated luminosity | $\int \mathcal{L}_{\text{target}}$ | ab^{-1} | 1 | 10 | 1 | 10 |
| Estimated luminosity | $\mathcal{L}_{\text{estimated}}$ | $10^{34} \text{cm}^{-2} \text{s}^{-1}$ | 1.8 | 17.5 | 0.9 | 7.9 |
| Collider circumference | C_{coll} | km | 4.5 | 11.4 | 11 | 11 |
| Collider arc peak field | B_{arc} | T | 11 | 14 | 4.8 | 11 |
| Collider dipole technology | | | Nb ₃ Sn | HTS | NbTi | Nb ₃ Sn or HTS |

RCS2: MBSC
RCS3: MBSC

What is included and what is not

- **Areas in green are included.** Some other areas are not sufficiently specified yet for a cost estimate.
- Available cost models were used, like for the cooling channel RF system, however R&D may introduce new requirements.
- On the other hand, beam dynamics design should not ignore cost implications of design choices and explore trade-offs with equipment experts.

RF Systems Estimate

- Multi-cell RF cavities, normal and super conducting technology. Same **tool** used for CLIC and FCC

| RF frequencies and gradients | | | |
|---|------|------|------|
| Proton driver - Linac | | | |
| RF frequencies | MHz | 352 | 704 |
| Muon cooling complex - 6D cooling | | | |
| RF frequencies | MHz | 352 | 704 |
| Maximum accelerating field | MV/m | 22 | 30 |
| Maximum accelerating field | MV/m | 35 | 50 |
| Muon cooling complex - Final cooling design in progress | | | |
| Acceleration complex - Low Energy Acceleration | | | |
| RF frequencies | MHz | 352 | 1056 |
| Maximum accelerating field | MV/m | 16 | 30 |
| Maximum accelerating field | MV/m | 25 | 45 |
| Acceleration complex - RCS | | | |
| RF frequency | MHz | 1300 | |
| Maximum accelerating field | MV/m | 30 | |
| Maximum accelerating field | MV/m | 45 | |

Carlo Rossi

NC and SC Cavity production

| Technology | |
|--|-----------------------|
| Cost raw material in CHF/m ² in kCHF (Cu or Nb sheet) - year 2017 | |
| Surface area per cell in m ² | |
| Surface beam tube in m ² | |
| Cell length in m | |
| Beam tube length per cell in m (total) | |
| | # of cells per cavity |
| Total length per cooling cell m | |
| Surface per cavity in m ² | |
| Cost cavity raw material | |
| Cost of half-cell fabrication (per pair) | |
| Cost of cut-off fabrication (per pair) | |
| Cost per cavity assembly (extras) | |
| Additional workshop costs per cavity (e.g. metrology) | |
| Total cost cavity fabrication | |
| Cost of cavity surface treatment (15 kCHF/m ²) | |
| Cost of heat treatment per cavity (10 kCHF) | |
| Cost of Nb coating per cavity (5 kCHF) | |
| Cost of HP rinsing per cavity (5 kCHF) | |
| Total cost of cavity SRF surface preparation | |
| Total cost of a bare cavity | |
| Cost of tuning system | |
| Cost per HOM coupler | |
| # of HOM coupler per cavity | |
| Cost per FCC (fixed LP = 70 kCHF, movable/HP = 150 kCHF) | |
| Cost of helium vessel/distribution per cavity | |
| Total cost of a dressed cavity | |
| | # cavities |
| Cost of cavities | |
| Optimized cost of cavities | |
| Cost of cryomodule frame (2kCHF/m) | |
| Cost of vacuum vessel | |
| Cost magnetic shielding (4 kCHF/m) | |
| Cost thermal shielding (4 kCHF/m) | |
| Cost for the assembly of a cryomodule | |
| Cost for cryo system (valves, exchangers, rupture discs...) | |
| Cost for vacuum system | |
| Cost for instrumentation | |
| Cost for HOM coaxial lines | |
| Total cost of a cryomodule | |
| Overhead for running & operation costs | |
| Total cost of a cryomodule | |
| number of cavities per stage | |

RF Power production

| Technology | |
|---|--|
| Cost of the WG system per klystron | |
| Cost of the WG support system per power source | |
| Cost of the RF circulators (400MHz - 2x, 800 MHz - 1x) | |
| Cost of the RF loads | |
| Cost of the RF circulator & RF load chassis per klystron | |
| Cost of arc detection system per klystron/SSA | |
| Cost of the RF dir. Couplers per klystron/SSA | |
| Cost of RF monitoring system (safety) | |
| Total cost of a RF power distribution system per klystron/SSA | |
| Cost of a HV distribution (surface-tunnel) | |
| Cost of a HV bunker (fraction per klystron/SSA -> 8 per bunker) | |
| Cost of the HV bunker equipment per klystron/SSA | |
| Cost of a HV cable set per klystron/SSA | |
| Cost of a crowbar system per klystron/SSA | |
| Total cost of a HV RF system per klystron/SSA | |
| Cost of the water cooling system per klystron/SSA | |
| Cost of the air cooling system per klystron/SSA | |
| Total cost of a cooling system per klystron/SSA | |
| Cost per klystron/SSA | |
| Cost of ionic pumps power supplies per klystron | |
| Cost of focus power supplies per klystron | |
| Cost of heating system per klystron | |
| Cost of RF driver per klystron/SSA | |
| Cost of DC power distribution per SSA (in bunkers) | |
| Cost controls racks per klystron/SSA | |
| Total cost of auxiliaries per klystron/SSA | |
| Total cost of a RF power system | |
| Overhead for running & operation costs | |
| Total cost of a RF power system | |

RF Systems Estimate

| RF frequencies and gradients | | | |
|---|------|------|------|
| Proton driver - Linac | | | |
| RF frequencies | MHz | 352 | 704 |
| Muon cooling complex - 6D cooling | | | |
| RF frequencies | MHz | 352 | 704 |
| Maximum accelerating field | MV/m | 22 | 30 |
| Maximum accelerating field | MV/m | 35 | 50 |
| Muon cooling complex - Final cooling <i>design in progress</i> | | | |
| Acceleration complex - Low Energy Acceleration | | | |
| RF frequencies | MHz | 352 | 1056 |
| Maximum accelerating field | MV/m | 16 | 30 |
| Maximum accelerating field | MV/m | 25 | 45 |
| Acceleration complex - RCS | | | |
| RF frequency | MHz | 1300 | |
| Maximum accelerating field | MV/m | 30 | |
| Maximum accelerating field | MV/m | 45 | |

Carlo Rossi

- Multi-cell RF cavities, normal and super conducting technology.
 - For **RCS top-down model** was scaled from ILC, based on TESLA – like cavity.

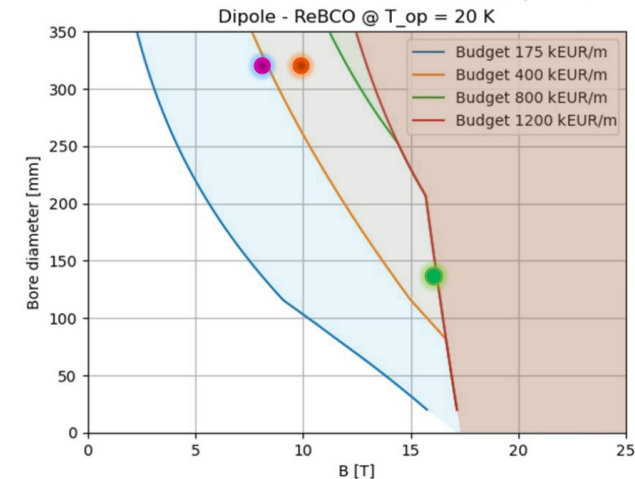

- For all other systems cost was scaled from cost models developed from LHC, CLIC, FCC cavities and associated RF equipment.

Magnets and Power Converters

- Very challenging developments in the field of NC and SC magnets
 - SC solenoids for the target, for the decay and cooling channels
 - NC magnets with fast cycling power converters for the RCSs
 - SC magnets for RCS and collider ring, with combined-function SC magnets in the collider ring.

| Magnet development targets | | | | | |
|----------------------------|----------------------------------|----------------|---------------|------------|---------------------------------|
| Complex | Magnet | No. of Magnets | Aperture [mm] | Length [m] | Field [T] / Gradient [T/m] |
| Target, decay and capture | Solenoid | 23 | 1380 | ~0.4 - 0.8 | 2 to 20 |
| 6D cooling | Solenoid | ~6000 | 90-1500 | 0.08 - 0.5 | 2 to 17 |
| Final cooling | Solenoid | 14 | 50 | 0.5 | >40 |
| RCS | NC dipole | ~1500 | 30x100 | 5 | -1.8 to +1.8 |
| | SC dipole | ~2500 | 30x100 | 1.5 | 10 |
| Collider ring | SC dipole | ~1050 | 100 - 140 | 5 | *16 |
| | Combined Function (Dip. + Quad.) | ~628 | 100 - 280 | 5. - 10. | 4 to 8 T / ~100 T/m to *320 T/m |
| | IR Quadrupoles | ~20 | 100 - 280 | 5.-10. | 110 T/m to *330 T/m |

- Development of a cost model, with benchmarking to existing projects.
 - **ABG plots with defined cost target and state-of-the-art power converter technology** were used to orient the estimate

Magnets and Power Converters

- Development of a **cost model**, with benchmarking to existing projects.

| | | Nb-Ti | Nb ₃ Sn (present) | Nb ₃ Sn (aspirational) | REBCO (present) | REBCO (aspirational) | BSCCO (present) | BSCCO (aspirational) |
|---|----------------------|-------|---------------------------------|--------------------------------------|--------------------|-------------------------|--------------------|-------------------------|

| $C_{\text{ColdMassMaterials}}^{\text{Ref}}$ | (kEUR/m) | 26.4 | | | | | | |
| B^{Ref} | (T) | 8.33 | | | | | | |
| $C_{\text{ColdMassManufacturing}}$ | (kEUR/m) | 26.4 | 31.7 | 31.7 | 26.4 | 26.4 | 31.7 | 31.7 |
| $C_{\text{CryoMagnet}}$ | (kEUR/m) | 8.0 | | | | | | |

Summary of cost

- The cost range for the different configurations was evaluated and compared to the Green Field scenario, where a cost for Civil Engineering of 50kCHF/m was assumed in the absence of a detailed study.

Relative cost for 3.2 TeV

Relative cost for 7.6 TeV

■ RF
 ■ Other Magnets
 ■ Power Converters
 ■ Solenoids
 ■ Civil Engineering
 ■ General infrastructure
 ■ Other

Cost sensitivity

- In the two configurations, the same technologies weigh differently in the cost uncertainty, showing the path for some risk mitigation.

Risk mitigation

- Investments in a substantial **R&D activity that can bring the relevant technologies to a TRL6 level** represent an effective strategy for **risk mitigation**.

Cost sensitivity

- Investments in a substantial **R&D activity** represent an effective strategy for **risk mitigation**.

Power Calculation

- Power needs were derived from **p Driver, RF systems, power converters and cryogenics.**

| | | RLA2 acc | RLA2 lin |

Carlo Rossi

Indications and Limits from the first exercise

- The early stage of the study does not allow to adopt a complete **bottom-up approach**.
- Cost drivers in the sensitivity analysis provide indications for a risk mitigation related to cost uncertainty.
- Only a substantial R&D can produce a reduction of that cost uncertainty.
- The present estimate remains a partial exercise, due to the not yet mature technical advancement in some areas. However it provides a frame to further develop our model and improve its accuracy.

Indications for the next iteration

- Few technical points are worth investigating in the light of **cost optimization**, like :
 - Review technical choices related to the cooling channel in the perspective of a cost optimization;
 - Explore the impact of transition energy from RLAs to RCS1;
 - Consider other acceleration techniques that may positively impact the final cost of the complex, like FFAG;
 - Consider the right trade-off between beam transmission efficiency and cost, after that all other aspects have been optimized.
- Permanently include cost considerations into the facility design for an early optimization of technical options.

IMCC and MuCol Annual Meeting

**Thanks to all colleagues in the Collaboration who
provided their contribution to this estimate**

IMCC and MuCol Annual Meeting

Thank you

IMCC and MuCol Annual Meeting

Additional Slides

The ITF Estimate

- A previous estimate was done in the frame of the Snowmass exercise in 2022, by using a multi-parameter cost model and starting from estimates provided by project proponents (B\$ in the scale below).

| Project Cost (no esc., no cont.) | 4 | 7 | 12 | 18 | 30 | 50 |
|-------------------------------------|---|---|----|----|----|----|
| MC-3 | | | | | | |
| MC-10 | | | | | | |

Estimate Classes

Recommended Practice No. 18R-97

Cost Estimate Classification System – As Applied in Engineering, Procurement, and Construction for the Process Industries

| ESTIMATE CLASS | Primary Characteristic | Secondary Characteristic | | | |
|----------------|--|--|--|---|--|
| | LEVEL OF PROJECT DEFINITION Expressed as % of complete definition | END USAGE Typical purpose of estimate | METHODOLOGY Typical estimating method | EXPECTED ACCURACY RANGE Typical variation in low and high ranges [a] | PREPARATION EFFORT Typical degree of effort relative to least cost index of 1 [b] |
| Class 5 | 0% to 2% | Concept Screening | Capacity Factored, Parametric Models, Judgment, or Analogy | L: -20% to -50% H: +30% to +100% | 1 |
| Class 4 | 1% to 15% | Study or Feasibility | Equipment Factored or Parametric Models | L: -15% to -30% H: +20% to +50% | 2 to 4 |
| Class 3 | 10% to 40% | Budget, Authorization, or Control | Semi-Detailed Unit Costs with Assembly Level Line Items | L: -10% to -20% H: +10% to +30% | 3 to 10 |
| Class 2 | 30% to 70% | Control or Bid/Tender | Detailed Unit Cost with Forced Detailed Take-Off | L: -5% to -15% H: +5% to +20% | 4 to 20 |
| Class 1 | 50% to 100% | Check Estimate or Bid/Tender | Detailed Unit Cost with Detailed Take-Off | L: -3% to -10% H: +3% to +15% | 5 to 100 |

Use an internationally recognized approach for the estimate of accuracy

Classes of estimate used for most areas of the MC facility.

Class of estimate that was used for established equipment like the RCS RF system, based on ILC technology.
