Introduction

The EuXFEL is the first free electron laser to produce ultra-short hard X-ray pulses at a megahertz repetition rate. This high repetition rate, combined with the exceptional transverse coherence, enables Megahertz X-ray Photon Correlation Spectroscopy (MHz-XPCS) to probe diffusive dynamics with (sub-) microsecond temporal resolution matching typical diffusion processes in dense cellular environments, therefore allowing to study the complex many-body interactions between proteins and their solvent at molecular length scales [1, 2]. In this poster, we present details on the experimental protocol and data processing for MHz-XPCS experiments on protein samples, implemented at the MID instrument of EuXFEL [3].

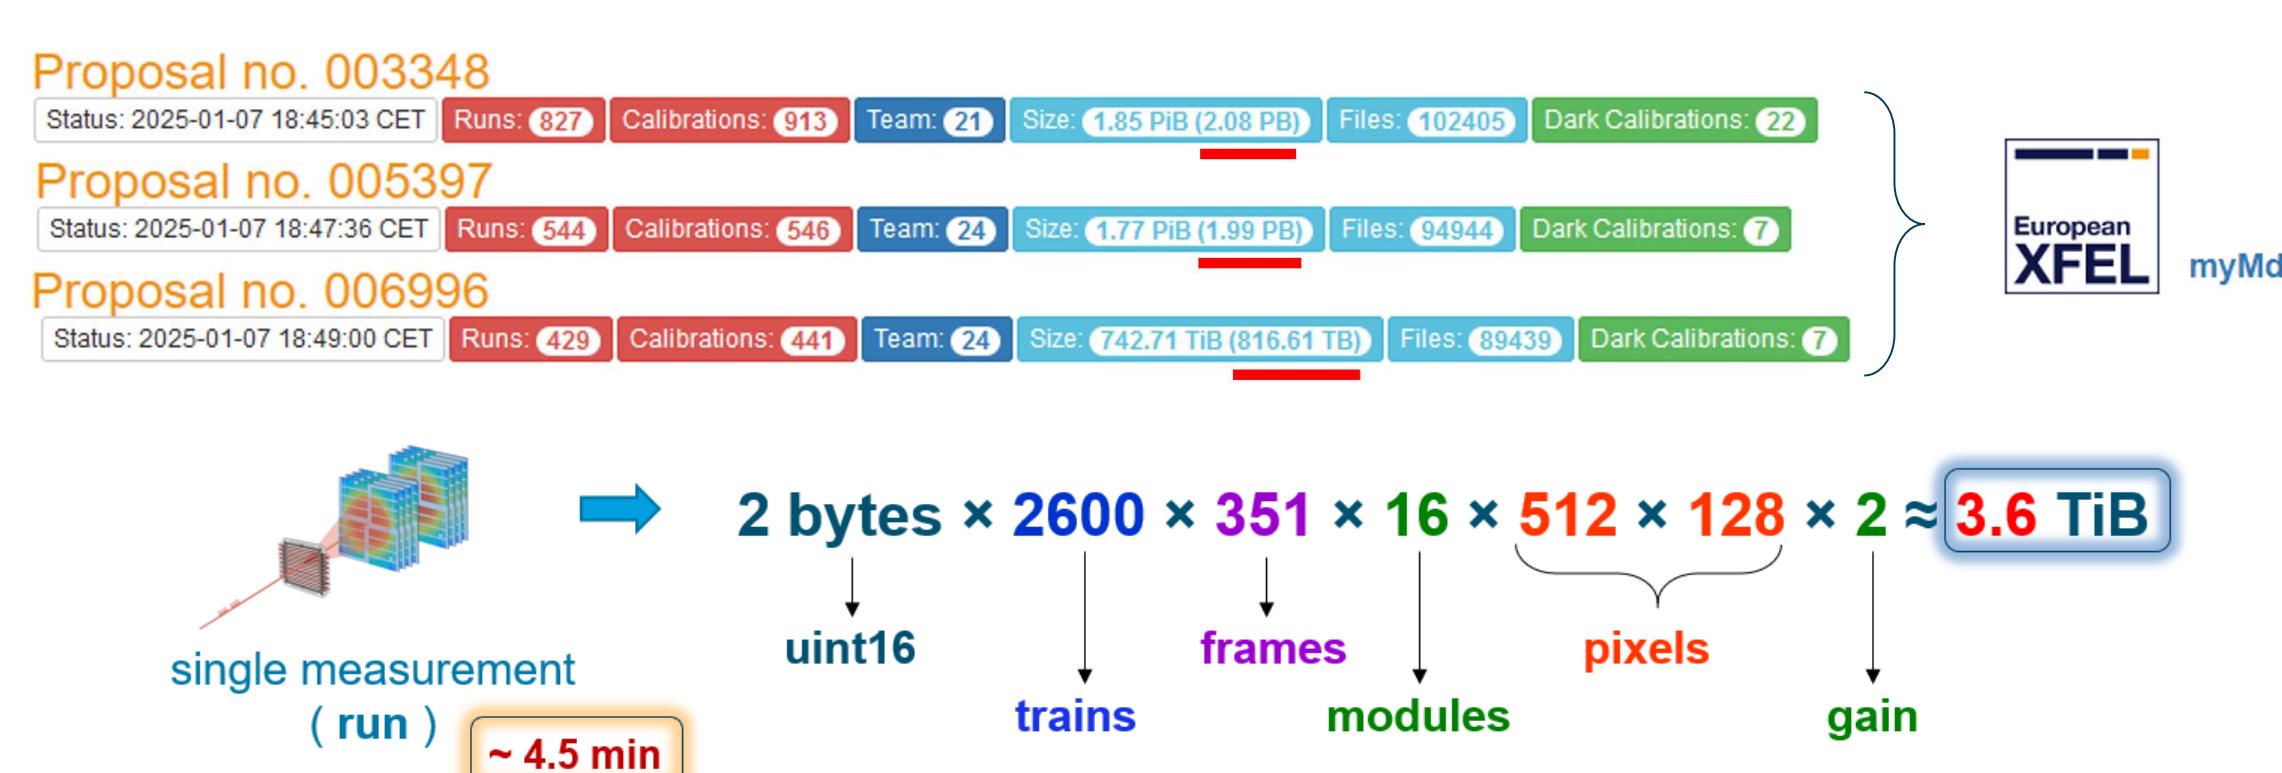

Experimental Protocol

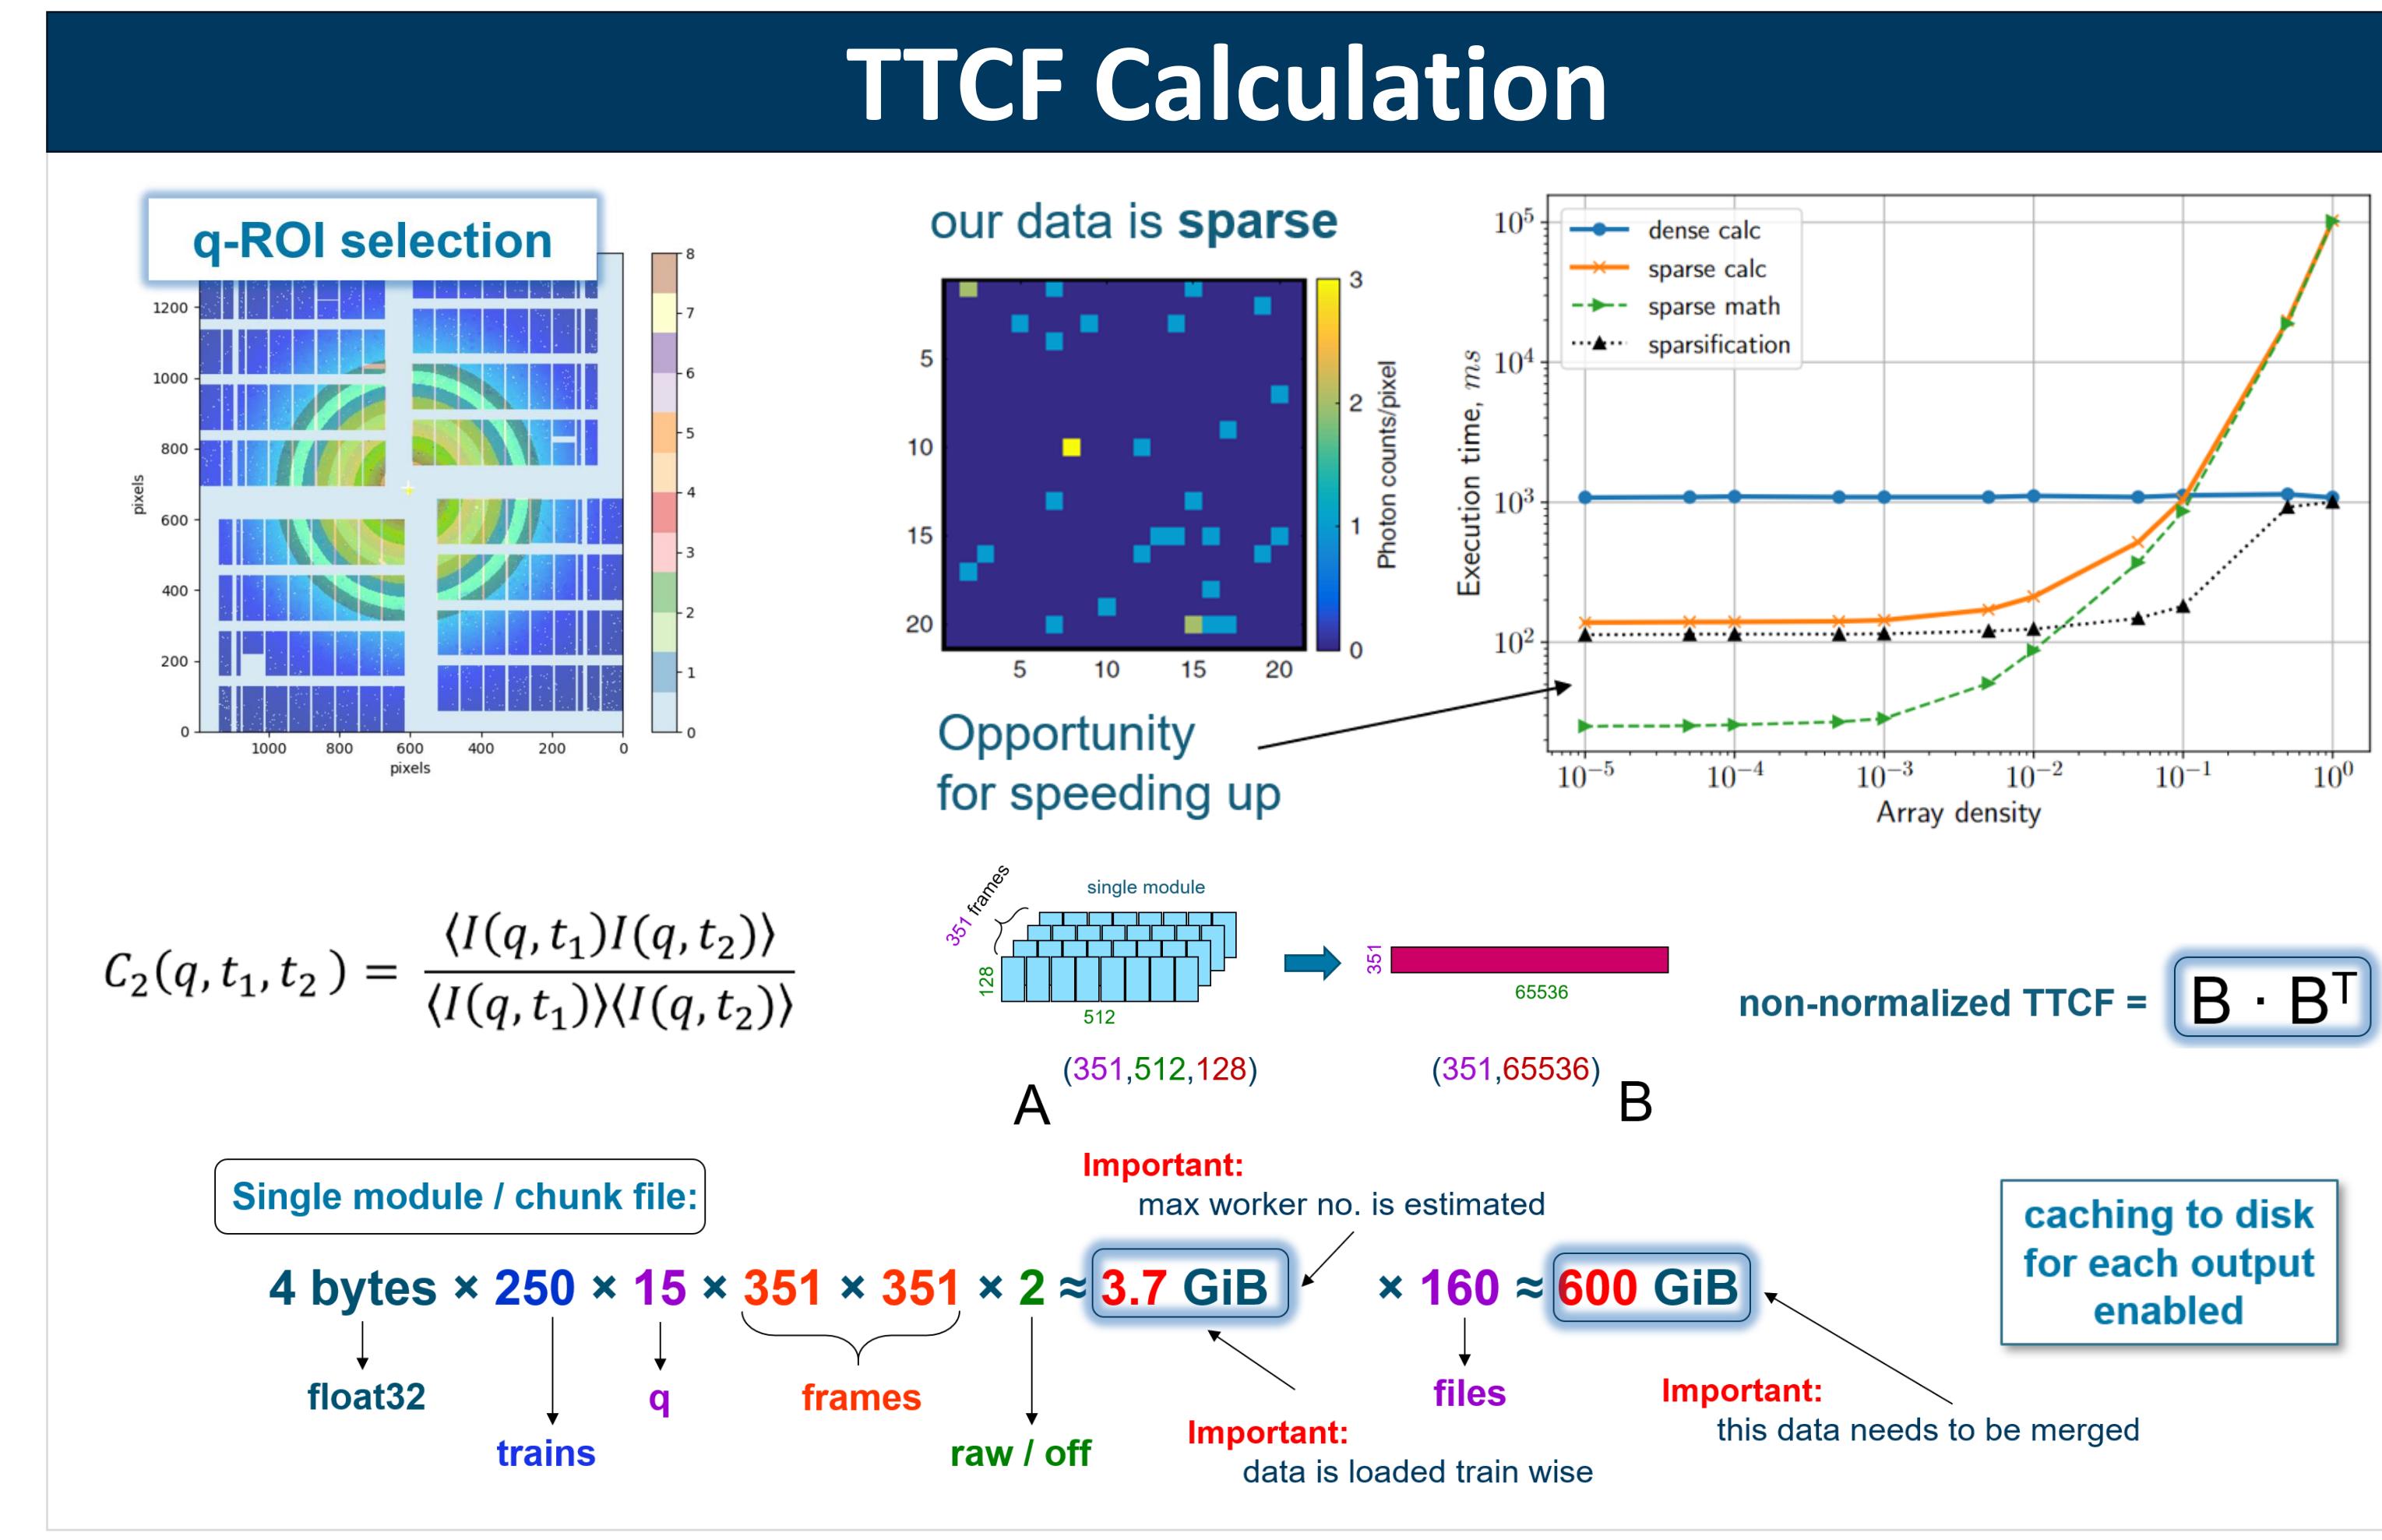

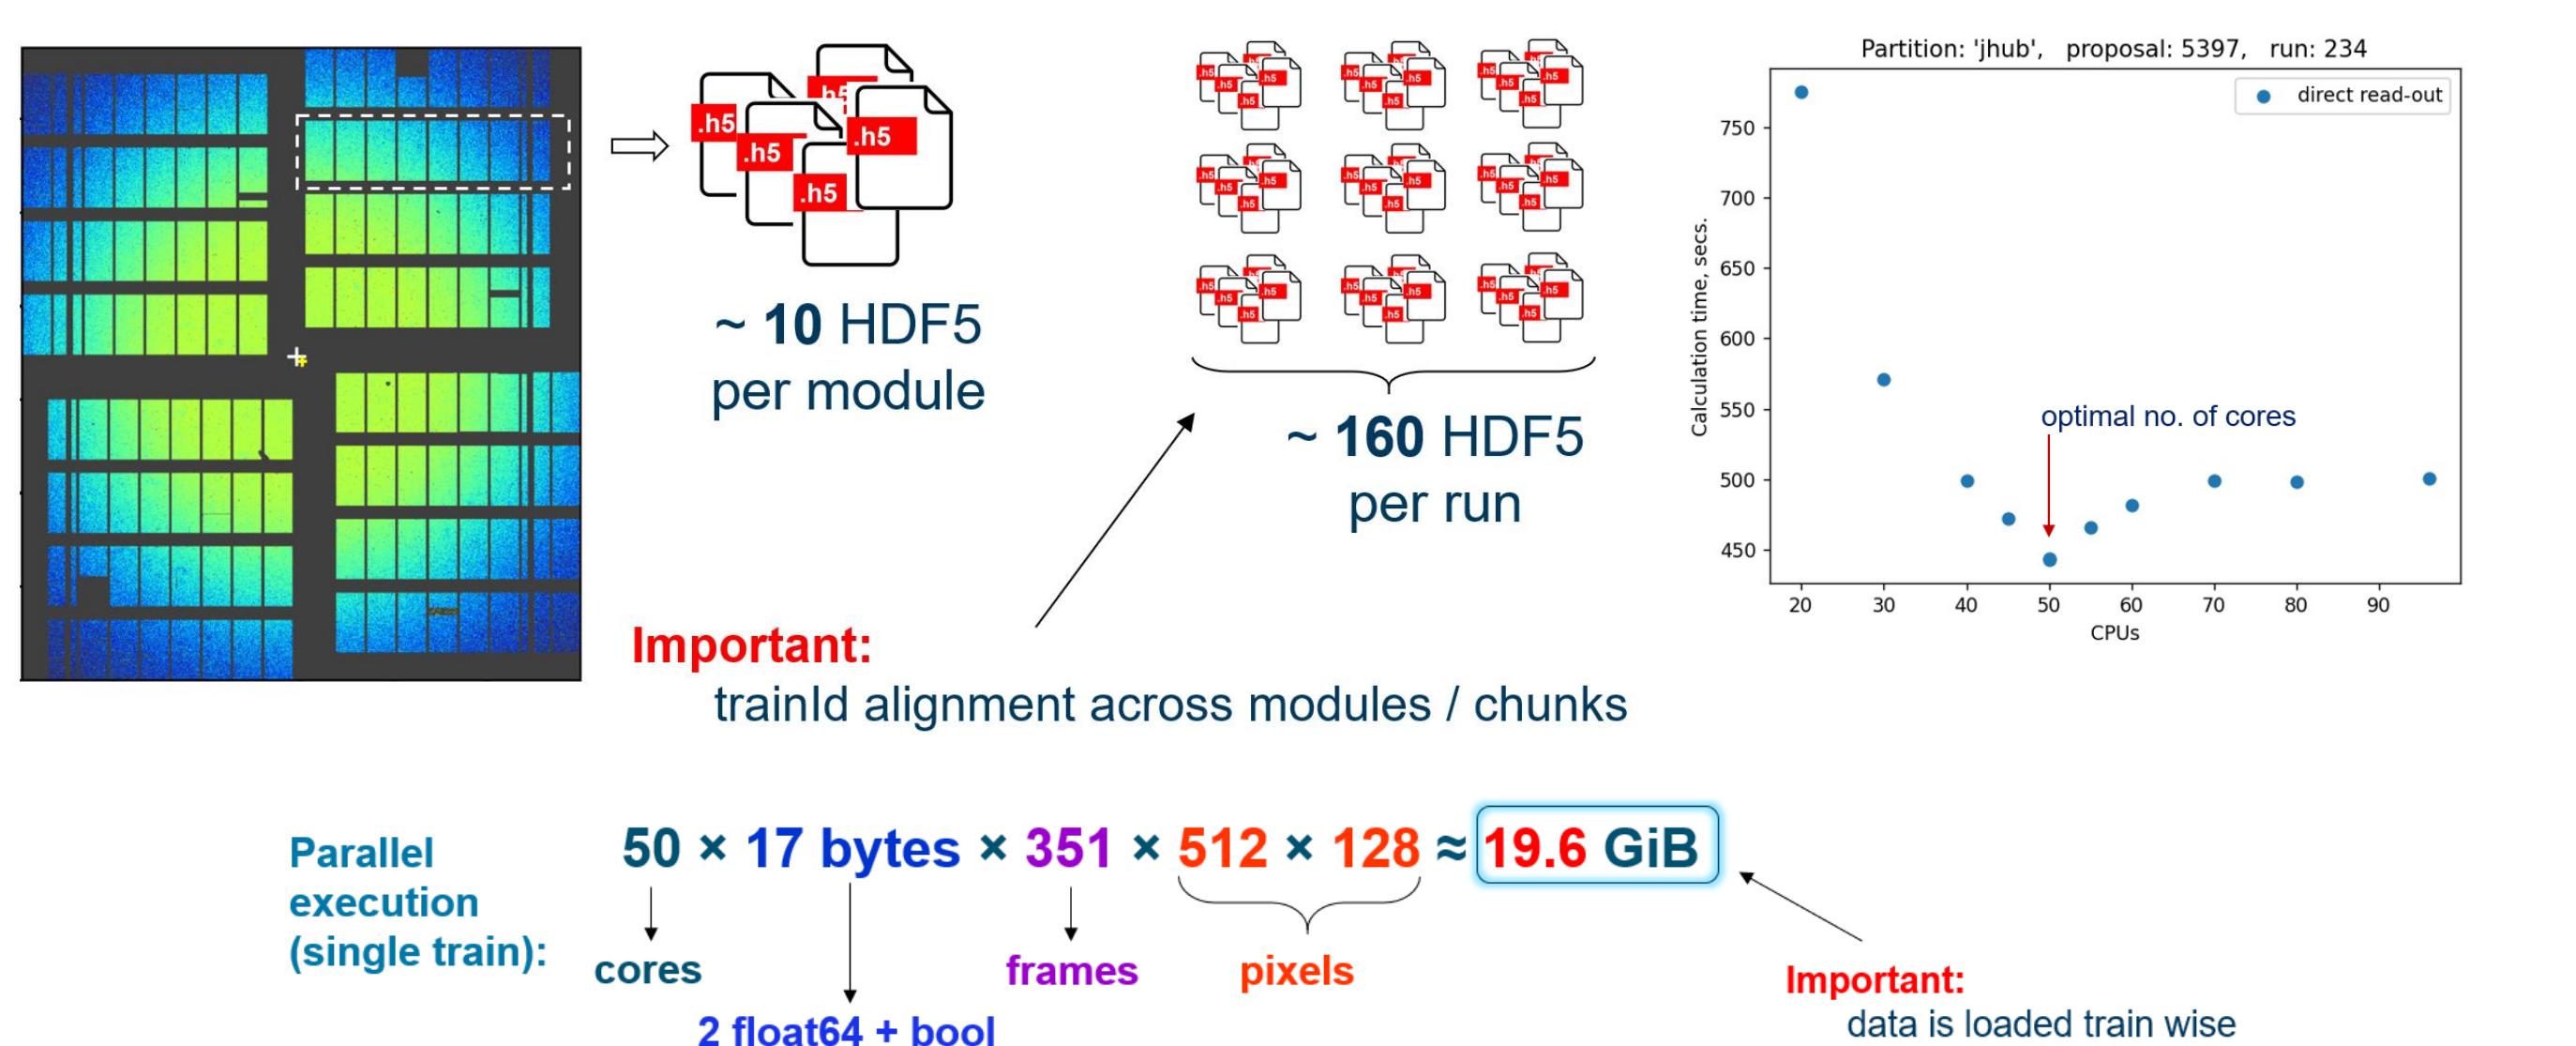

MHz-XPCS Data Pipeline: Overview

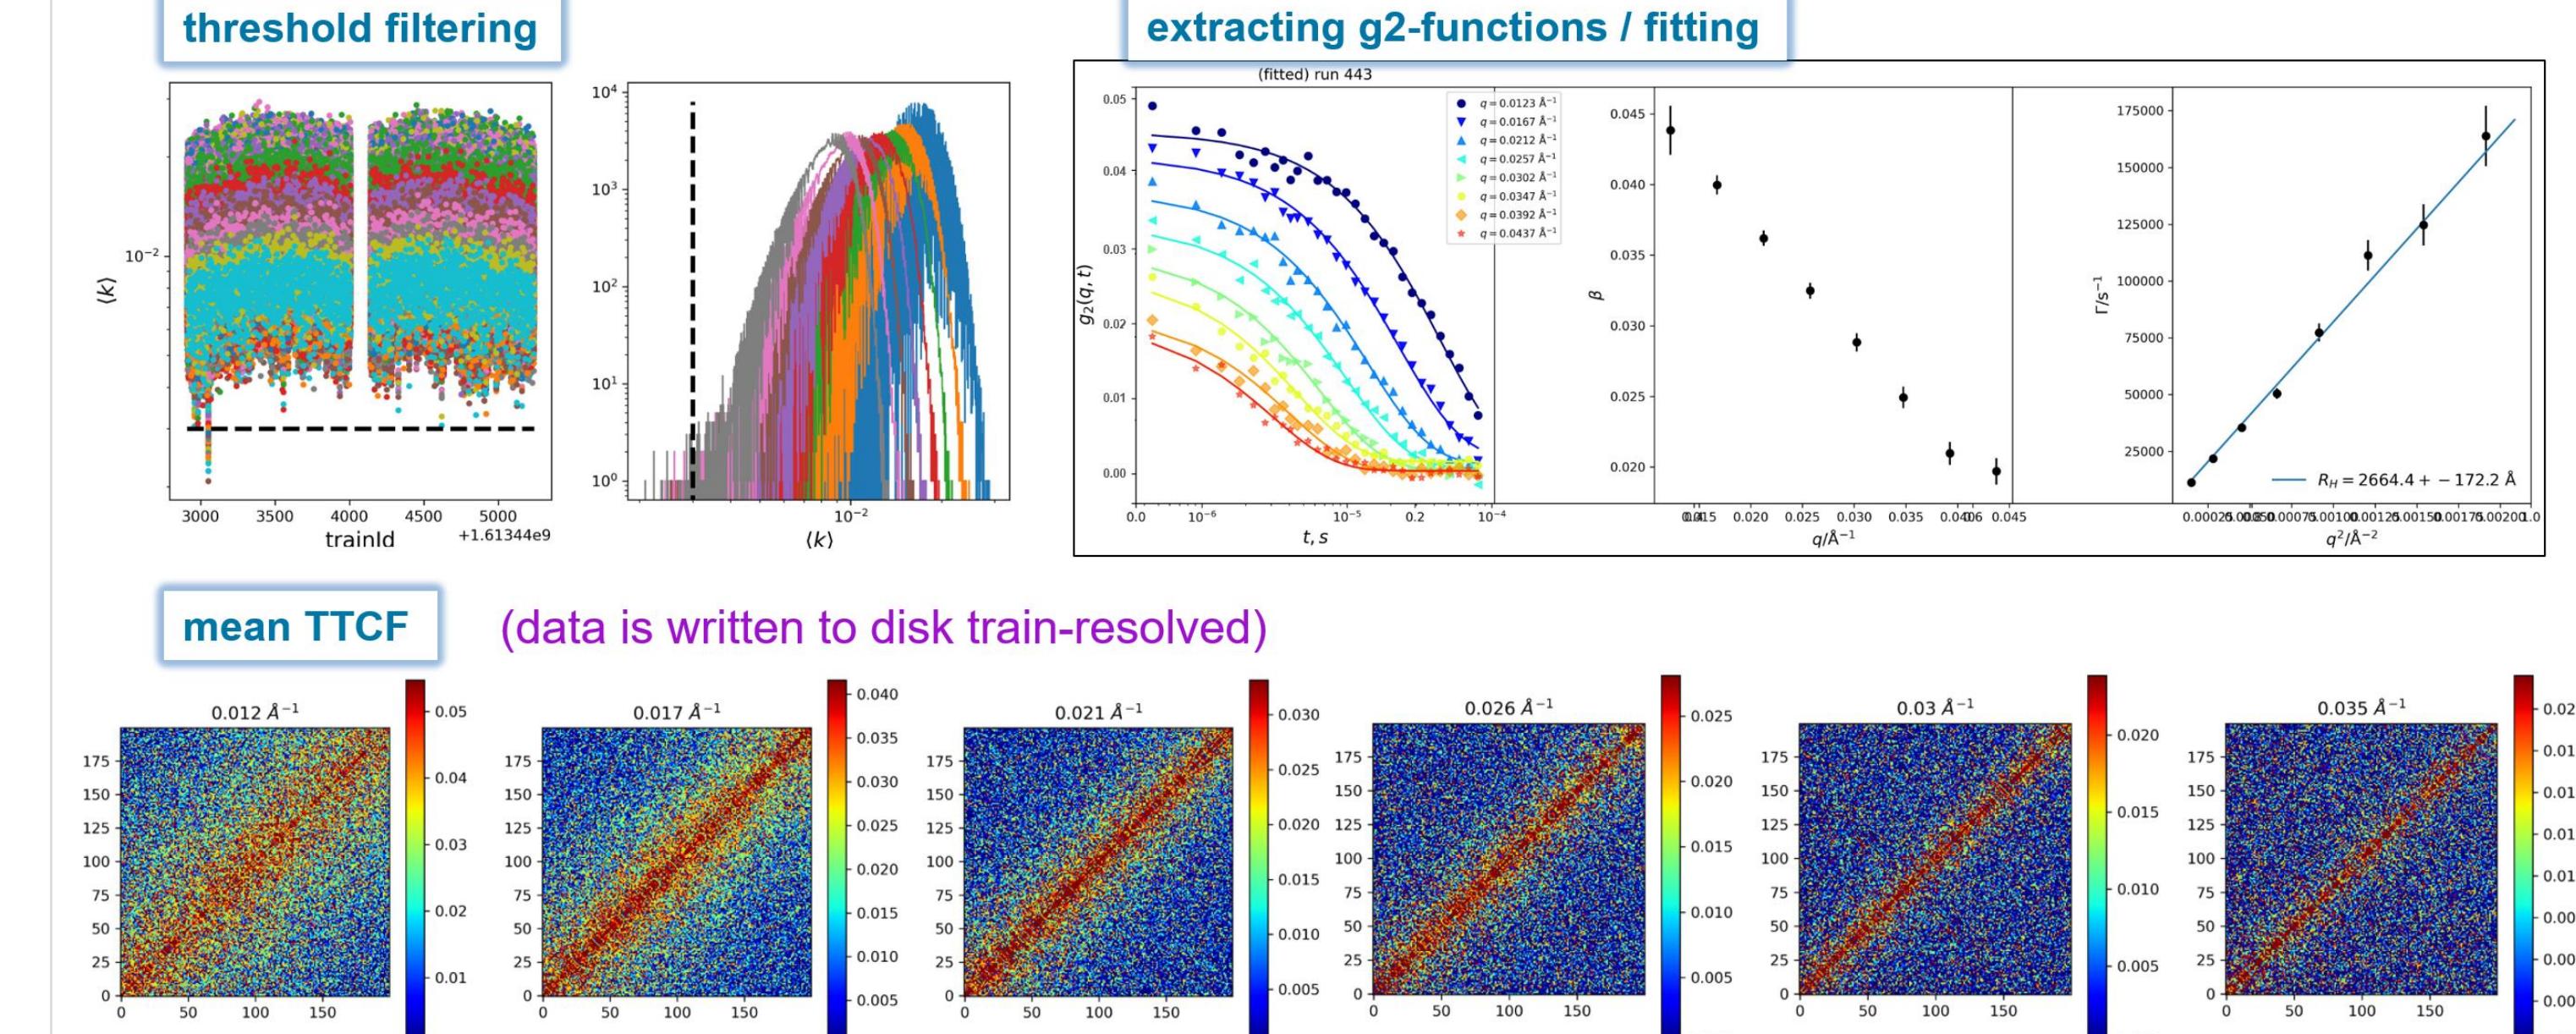

Data Volumes with MHz-XPCS

Mean Pixel-Cell Calculation

Post-Processing of Data
