Identifying Boosted Top Quarks

— in CMS —

- different approaches to top tagging:
 - ▶ **machine learning** algorithms
DeepAK8, ParticleNet, ...
 - ▶ **cut based** using jet substructure techniques
N-subjettiness, soft drop mass

Identifying Boosted Top Quarks

IV. Statistical Analysis

Event Selection

— efficiency per process —

- 1 exactly one electron/muon
- 2 missing transverse momentum
- 3 at least two jets
- 4 at least one b-tagged jet
- 5 at high p_T of lepton:
jet-lepton 2D isolation
(relative momentum and spatial distance)
- 6 orthogonality to other channels

Reconstruct $t\bar{t}$ System

- boosted regime:
assign top tagged large-radius jet to hadronic leg
- resolved regime:
full jet combinatorics for both decay legs
- choose best hypothesis based on χ^2 criterion

Reconstruct $t\bar{t}$ System

- boosted regime:
assign top tagged large-radius jet to hadronic leg
- resolved regime:
full jet combinatorics for both decay legs
- ▶ choose best hypothesis based on χ^2 criterion

- generally, large combinatorics due to many jets in events
- memory intensive, also due to columnar based analysis
 - ▶ limit number of jets used for reconstruction without impacting efficiency of reconstruction

Reconstructed $t\bar{t}$ System

Outlook

— Run 2: DNN approach and statistical analysis —

- simple neural network setup for event classification:

- 59 low level input features
- 2 hidden layers
- 4 output nodes:
t \bar{t} bar, single top, W+jets, DY

- enrich signal region with t \bar{t} bar events to enhance sensitivity
- use control regions to constrain backgrounds

Outlook

— Run 2: DNN approach and statistical analysis —

- simple neural network setup for event classification:

- ▶ 59 low level input features
- ▶ 2 hidden layers
- ▶ 4 output nodes:
t \bar{t} bar, single top, W+jets, DY

- ▶ enrich signal region with t \bar{t} bar events to enhance sensitivity
- ▶ use control regions to constrain backgrounds

- template-based binned likelihood fit with ditop mass as sensitive variable using CMS combine tool

- if no significant excess observed:
set upper limits on
 $\sigma_{Z'} \times BR(Z' \rightarrow t\bar{t})$ at 95 % confidence level

for illustration:

Summary

- identification of boosted objects essential step in many analyses
- **boosted top quarks** as potential window to BSM physics
 - Run 2 analysis expected to be published very soon
 - Run 3 analysis setup to look into new data
- understand **cut based top tagging algorithm** using jet substructure and soft drop mass
 - derive working points and scale factors

Summary

→ fails for wide-angle soft radiation

Tag and Probe Method With $t\bar{t}$ Pairs

- single lepton
- $p_{T, \text{lep}} > 55 \text{ GeV}$

- b-tagged AK4 jet close to lepton
- $p_{T, \text{AK4}} > 15 \text{ GeV}$

- $p_T^{\text{miss}} > 50 \text{ GeV}$
- $p_{T(W_{\text{lep}})} > 150 \text{ GeV}$

- $p_{T, \text{AK8}} > 300 \text{ GeV}$
- jet-lepton 2D isolation

Merge Category Algorithm

— process_ids producer—

Process	Decay mode	# of merged quarks	Subprocess
tt	semi-leptonic	3	tt_3q
		2	tt_2q
		1 or 0	tt_1o0q
	dileptonic or fully hadronic	any	tt_bkg
st	hadronic	3	st_3q
		2	st_2q
		1 or 0	st_1o0q

Process	Top decay	Assoc. W decay	# of merged quarks	Subprocess
st_tW	leptonic	hadronic	3	st_bkg*
			2	st_2q
			1 or 0	st_1o0q
st_tW	leptonic	leptonic	any	st_bkg
st_other	leptonic	--	any	st_bkg

process ID set per event from gen level info:

1. Check if **st** or **tt**.
2. Check if **bkg**:
no probejet
OR top decay merged into probejet not hadronic
OR associated b quark and both associated W
decay products merge into probejet
3. Check if **3q** or **2q**:
not **bkg**
AND exactly 3/2 quarks merged into probejet
4. Check if **0o1q**:
not **bkg**
AND 0 or 1 quarks are merged into probejet

Impacts
