QuantumUniverse Attract.Workshop  
November 25, 2025

# Supersymmetric quantum field theories

Quantum field theory (QFT) = mathematical framework for diverse physics phenomena

- experimentally verified
- intractable for strong coupling

# Supersymmetric quantum field theories

Quantum field theory (QFT) = mathematical framework for diverse physics phenomena

- experimentally verified
- intractable for strong coupling

⇒ Introduce **supersymmetry**

~> more control over quantum corrections

# Review of 3d $\mathcal{N} = 4$ theories

Large, highly symmetric moduli space of vacua  
 $\leadsto$  has two maximal branches:

## Higgs branch

- classical
- Hyper-Kähler quotient

## Coulomb branch

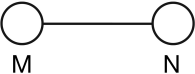

- quantum
- general symplectic singularity

# Review of 3d $\mathcal{N} = 4$ theories

- Both are singular spaces: singularities where gauge symmetry partially restored  
 $\leadsto$  new massless states
- Both admit stratification into symplectic leaves  $\mathcal{L}$   
 $\leadsto$  partial order in **Hasse diagram**

# Quivers in supersymmetric QFTs

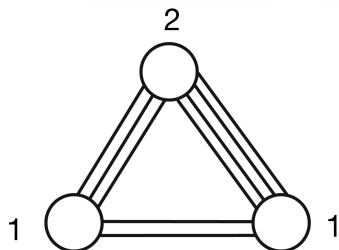

- graphical depiction of 3d  $\mathcal{N} = 4$  field content

Quiver component	Field interpretation
	$\mathcal{N} = 4$ vector multiplet
	$\mathcal{N} = 4$ hypermultiplet

# Higgs mechanism on the Higgs branch

- parametrized by scalar fields  
     $\leadsto$  Higgsed in multiple ways
- 2 algorithms :
  - Quiver subtraction [[arXiv:2409.16356](#)]
  - Ext-quivers [[Crawley-Boevey '01](#)], [[Nakajima '94](#)]

# From now on: Example

$$A = \begin{pmatrix} -2 & 3 & 2 \\ 3 & -2 & 4 \\ 2 & 4 & -2 \end{pmatrix}$$

$$K = \begin{pmatrix} 1 \\ 2 \\ 1 \end{pmatrix}$$

Real roots:

$$R_R = \{(1, 0, 0), (0, 1, 0), (0, 0, 1)\}$$

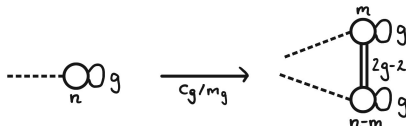

Imaginary roots:

$$I_R = \{(0, 1, 1), (0, 2, 1), (1, 0, 1), (1, 1, 0), (1, 1, 1), (1, 2, 1)\}$$

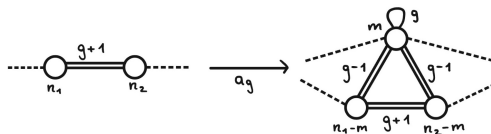

# Hasse diagram via quiver subtraction [2409.16356]

Rules of quiver subtraction:

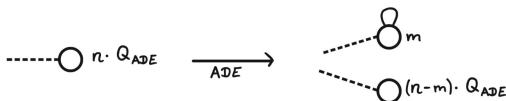

- Rule 1:

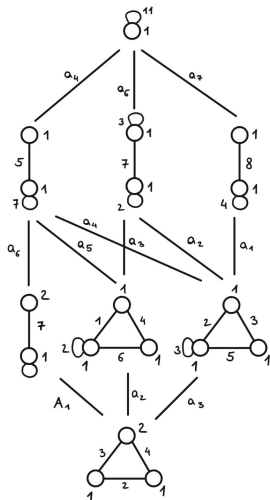

- Rule 2:

- Rule 3:

# Hasse diagram via quiver subtraction [2409.16356]

# Building the Ext-quiver [Crawley-Boevey '01]

Representation type of  $\mathcal{L} : \tau = (n_1, \beta^{(1)}; \dots; n_k, \beta^{(k)})$

$n_i$  = multiplicity

$\beta^{(i)}$  = dimension vector

so that  $K = \sum_{i=1}^k n_i \beta^{(i)}$

- symplectic leaves labelled by  $\tau$  of  $K$
- construct local quiver on a leaf = **Ext-quiver**

# Building the Ext-quiver

Representation types of K:

$$1 \cdot (1, 0, 0) + 2 \cdot (0, 1, 0) + 1 \cdot (0, 0, 1)$$

$$1 \cdot (1, 2, 1)$$

$$1 \cdot (1, 1, 1) + 1 \cdot (0, 1, 0)$$

$$1 \cdot (1, 1, 0) + 1 \cdot (0, 1, 0) + 1 \cdot (0, 0, 1)$$

$$1 \cdot (1, 0, 1) + 2 \cdot (0, 1, 0)$$

$$1 \cdot (0, 2, 1) + 1 \cdot (1, 0, 0)$$

$$1 \cdot (0, 1, 1) + 1 \cdot (1, 0, 0) + 1 \cdot (0, 1, 0)$$

$$1 \cdot (0, 1, 1) + 1 \cdot (1, 1, 0)$$

↪ Each quiver is the same as in quiver subtraction Hasse diagram

# Hasse diagram via Ext-quiver

Goal:

- partial order on  $I_R$  to obtain Hasse diagram  
     $\leadsto$  same as for quiver subtraction
- Relation between quiver subtraction rules and change of decompositions

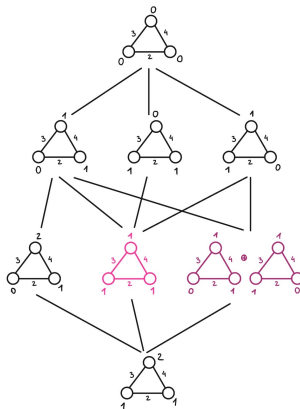

# Higgs mechanism on the Coulomb branch

Obtain Hasse diagram by Decay & Fission algorithm

[arXiv:2401.08757]

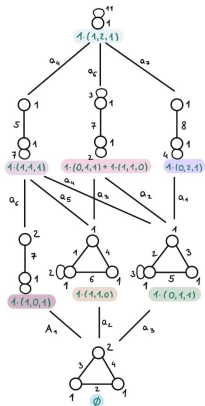

**Decay:** smaller rank

**Fission:** splits into two parts but total rank preserved

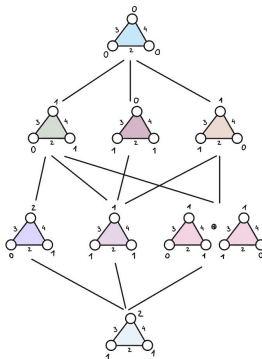

## Comparison of both branches

Higgs branch (HB)

### Coulomb branch (CB)

# Comparison of both branches

Goal:

- map between partial order on Higgs branch and Coulomb branch
- Symplectic duality?:
  - Same amount of leaves on HB and CB
  - isometries of HB describe resolutions of CB and vice versa

Thank you!
