

- Introduction: objectives and tasks of WP-5
- WP-5 activities at DESY
- Requirements for the virtual labs

- Demonstrate PANDATA services and JRA results using 3 different techniques
 - Structural ‘joint refinement’ against X-ray and neutron powder diffraction data, VL1
 - Simultaneous analysis of SAXS and SANS data for large scale structures, VL2
 - Access to tomography data exemplified through paleontological samples, VL3

- An authenticated user searches data in a catalogue
- Access is authorized and data downloaded from facility archive
- Search relevant software in a database
- Download software and run it locally or at the facility
- Analyze data
- Upload results and any relevant reduced data to facility archive

- Setup a public access DB for storing tomographic raw and processed data of paleontological data e.g. 2D tomographs and 3D processed images
- Provide authorized access from multiple institutes to store processed data in the data base
- Enable public access to data in database
- Implement long term archiving for database

- Collect the requirements for the WPs
- Implement SDF, install Umbrella and ICAT at DESY
- Download/upload software from/to PANSOFT
- Make Tests
 - need help for the neutron analysis
- Give feedback to the service providers
- Report on the implementation
- VL3 questions
 - Who has data of paleontological samples?
 - Who is going to work with the data?
 - Is VL3 just a specific view in the data catalogue?

- new c++ library, exclusively based on HDF5
 - Purely object-oriented interface, for details see Eugen Wintersbergers talk
 - Coordinated with NIAC
 - Status: API published
 - Code on source forge
 - <https://sourceforge.net/projects/libpninx>
 - <https://sourceforge.net/projects/libpniutils>
- Python bindings
 - Status: ongoing

- Finalizing NeXus application definitions for scattering experiments, see talk of Rainer Gehrke
- Next steps:
 - Implementation at PETRA III beamlines, starting with SAXS, date: Apr, 1st, new colleague
 - NeXus writer : Tango server
 - Configuration files to generate meta-data
 - Collect data from other Tango servers
 - Adaptation of analysis software
 - Setup work flow

-
- DOOR/Umbrella prototype, <https://shibs.desy.de>
 - (Door login)
 - Register at Shibboleth (umbrella.psi.ch)
 - Match DOOR & Shibboleth accounts
 - EAA Login (Umbrella)

DOOR DESY ONLINE OFFICE FOR RESEARCH WITH PHOTONS
Umbrella prototype

HASYLAB | DORIS III | PETRA III | FLASH | DESY

- DOOR/Umbrella prototype, <https://shibs.desy.de>
 - (Door login)
 - Register at shibboleth (umbrella.psi.ch)
 - Match Door & Shibboleth account
 - EAA Login (Umbrella)
- Friendly user phase
- Status: Test system is operational
- Future plans: use Umbrella for DOOR and data portal

WP-5 collects the requirements for the other work packages → D 5.1

- Standard data format
- Authentication
- Data catalogue
- Software catalogue
- Provenance
- Preservation
- Scalability

User vs. service provider perspective.

A questionnaire will be prepared that should cover all relevant issues.

- PANDATA Europe: HDF5 agreed, NeXus is 'starting point' for file structures and application definitions
- General implementation of the SDF
- Application definitions
- Full description of the experiment and measurement within the files
- Data compression
- Converters to other file formats

- Problem:
 - NeXus files from different facilities may not be fully standardized
 - Old, non-NeXus files exist and need to be processed
- Possible solution: customize applications

cdma

Common Data Model API

- A dictionary translates application notions to file entities
- It uses plugins to adapt to different formats
- Was presented on a PANDATA workshop by Alain Buteau and Majid Ounsy
- DESY decided to join this initiative

- PANDATA-Europe:  Umbrella
- Single-sign-on to PANDATA partners
 - Digital user office
 - Data portal
- Common proposal submission system (?)

- ODI proposal: ICAT is a strong candidate
- Data portal
- Federated catalogue
- Authentication
- Data download
- Keyword based searches
- Specify metadata
- Data viewer (?)
- Authorization management
- Performance
 - Response time for searches
 - Size of the catalogue
 - Download speed
- Cite data and link data and publications

- PANDATA-Europe: PaNsoft
- List of available software
 - Versions identified by DOIs
- Metadata
 - Author, maintainer
 - Download server
 - Supported data formats
 - Supported platforms
 - Detailed description, including experimental techniques using a ‘common vocabulary’
 - Usage guide
- Forum
 - Bug fixing
 - New features
 - Ranking

The screenshot shows the PaNsoft website interface. At the top, there is a navigation bar with the PaNsoft logo, a search bar, and links for Help & Support, Software Catalogue, Institutes, Login, and Register. A dropdown menu is open, showing options for Forums, Best Practices, Public Web Services, and About. Below the navigation bar, there is a map of Europe with various experimental facilities marked, including ISIS, ILL, SOLEIL, and FET. To the right of the map, the title 'Photon and Neutron Software Catalogue' is displayed, followed by a description of PaNsoft as a database of software for data analysis of neutron and photon experiments. A 'Browse software' button is visible below the text. At the bottom of the page, there are tabs for 'Software: Recent Software' and 'Popular Software'.

- Data download may not be possible due to large data volumes
 - Current data rates: 1-10 TB per day per experiment
 - Network speed: 2 x 10 Gbps (DESY) → 30 TB/day
 - Will the network bandwidth cope with the new detector outputs?
- Reconstruction/analysis/simulation preferably guided by the facility experts
- Once established, work flows can also be used for near real time analysis for a fast feedback of the ongoing measurement
- Candidates: DAWB, ...

- Allow analysis validation
- Record the analysis process
- Common information model
 - Domain ontologies: beamline, instrument, equipment, techniques
 - Corresponds to SDF goals

- Long term data storage: 10 years (?)
- Facility handles media changes
- Data access independent of platform
- Metadata management during the whole data live time

Parallel file system & parallelized SDF

- Fast data storage has to cope with modern detectors
- Analysis within reasonable time:
 - Disk space is limited, e.g. DESY Online file servers: 140 TB
 - Goal: steady state data flow
 - Sufficient compute resources (not by PANDATA)
 - Fast data access, possibly adapted to specific techniques
- Near online analysis needs fast data access
- Users and facility scientists need a work flow management system

- Discussion, feedback
- Prepare a questionnaire and send it to WP-5 contact persons
- Collect the results
- Prepare D 5.1
