

The Experimental Status of QCD

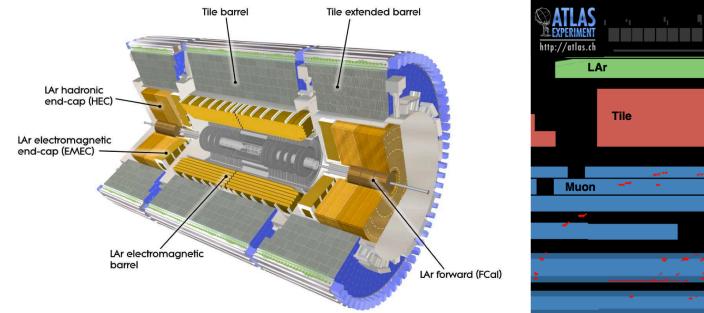

Zach Marshall (CERN) Lessons from the First Phase of the LHC DESY Hamburg, 25 Sept 2012

Overview

- Quick reminders of detectors and reconstruction, jet energy scale uncertainties, and associated issues
 - I'll try to focus on the *difference* between ATLAS and CMS
- Standard measurements
 - Many of these distributions are used also for *searches*. Proper Standard Model measurements require the unfolding of detector effects, so you'll see them with somewhat less data.
- Jet properties and substructure
 - Measurements of jet shapes, fragmentation functions, etc are now getting quite extensive. Dependent on numerical models as much as real pQCD theory, but wide-ranging impact.
- Fat jets and their properties
 - The new hot topic for searches but QCD has to be understood first!
- Jets in heavy ion collisions (briefly)
 - Not standard QCD measurements, but quite interesting!

ATLAS: Calo-centric Jets

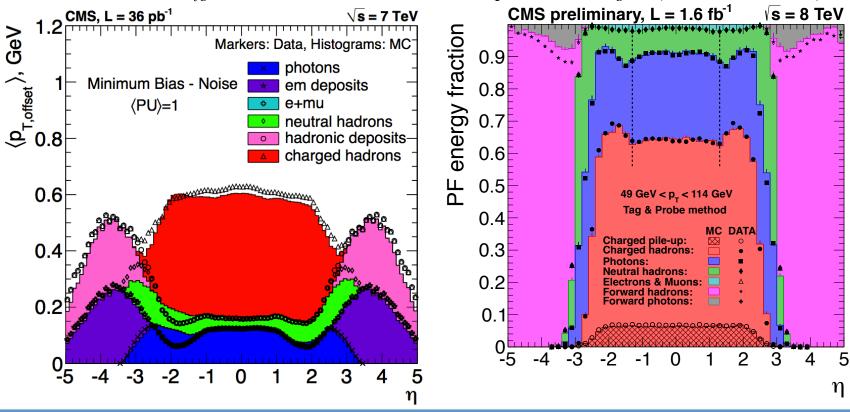

- ATLAS has a thick and high-quality hadronic calorimeter, so simple calorimeter-only reconstruction does well, though punch-through still exists
- Most jets start from *clusters* of energy (for noise suppression)
- Several different calibration techniques to account for non-compensation
- Tracks are used for *corrections* to the calibration, not to replace any calorimeter information
 - Also used to *add* information, in the case of jet-vertex association
- Several calibrated algorithms: anti- $k_t R = 0.4/0.6/1.2$, and C/A R=1.0, 1.2

Z Marshall - Experimental QCD; DESY 2012 Theory Workshop

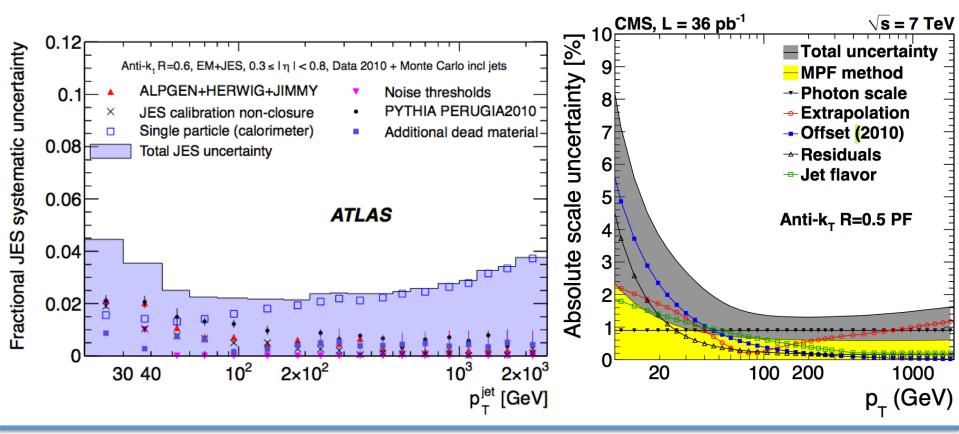

CMS: Global Event Description

- CMS have an all-silicon tracker used extensively in jet reconstruction
- Particle flow used to *replace* inaccurate calorimeter measurements with more accurate tracker measurements, then sets a component-wise systematic uncertainty
- Requires classifying energy deposits in the calorimeter as EM or hadronic and calibrating them separately
- Focus on anti- k_t jets with R=0.5/0.7; also non-particle flow jets (calo, calo+track)

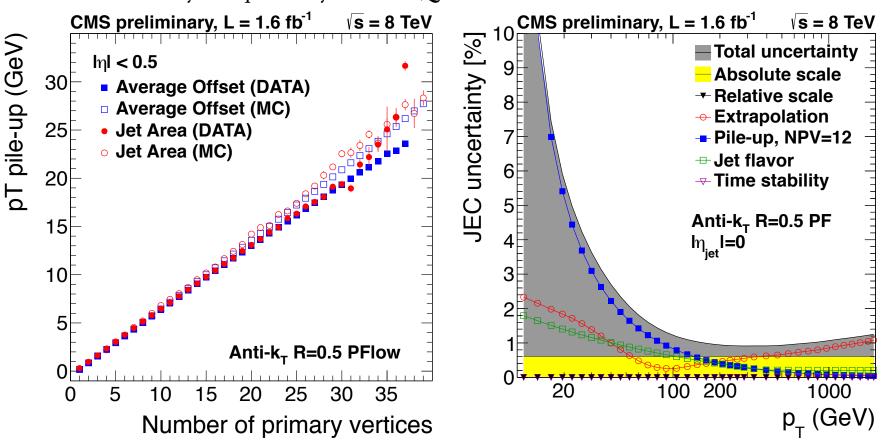

Jet Calibration

- Both collaborations calibrate to *hadron-level* jets
 - Not the same as parton-level calibrations!
 - Both wrote long papers on our 2010 calibrations, arXiv:1107.4277 and arXiv:1112.6426
- We're both still finishing documentation of the 2011 calibration!
 - More papers, documentation, and discussion coming soon

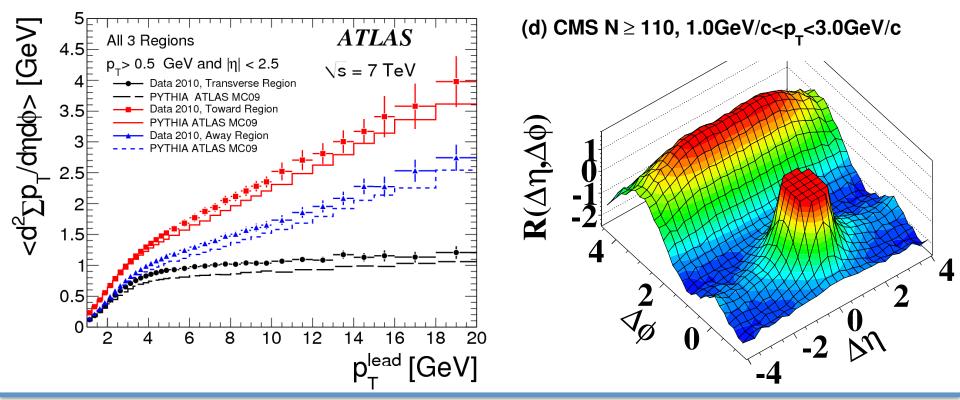

Pile-Up

- In 2011, and even more in 2012, additional pp collisions in each bunch-crossing is a *major* experimental challenge
 - ~ 10 in 2011, ~ 15 in 2012, with a tail over 30!
 - Probably the primary reason QCD measurements are slow to come out

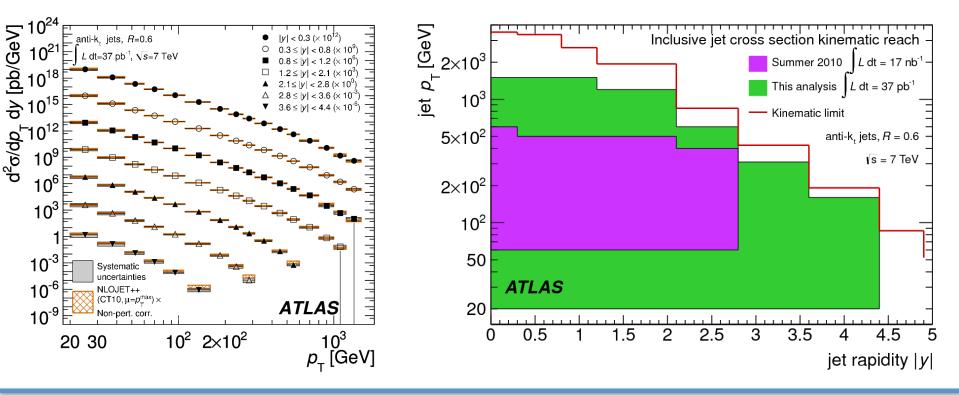

Soft QCD

- I won't say much here about soft QCD except to say that we have measured it in quite some detail (e.g. the usual towards-away-transverse UE)
- So far, the most useful thing to come out of it are the generator tunes that give us faith in our modeling of the soft part of the interactions
- Some significant interest was generated around CMS's angular correlations (right), but it seems to have faded somewhat

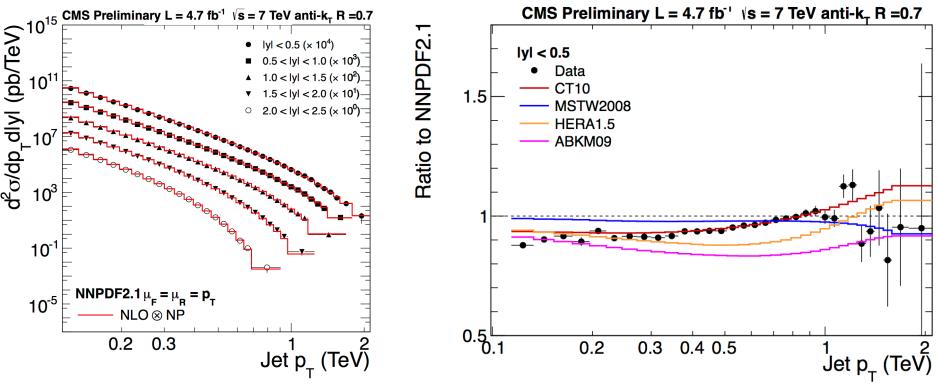

Inclusive Jet Cross-Sections arXiv:1112.6297 arXiv:1106.0208

- Both experiments have published 2010 cross-section measurements over a huge p_T and η range almost the entire kinematically accessible region!
- >8 orders of magnitude in cross-section an impressive achievement, requiring *excellent* understanding of the detector and jet energy scales
- Measured for 4 jet sizes: 0.4 (ATLAS), 0.5 (CMS), 0.6 (ATLAS), 0.7 (CMS)
 - Plans to measure R-dependence explicitly for both ATLAS and CMS

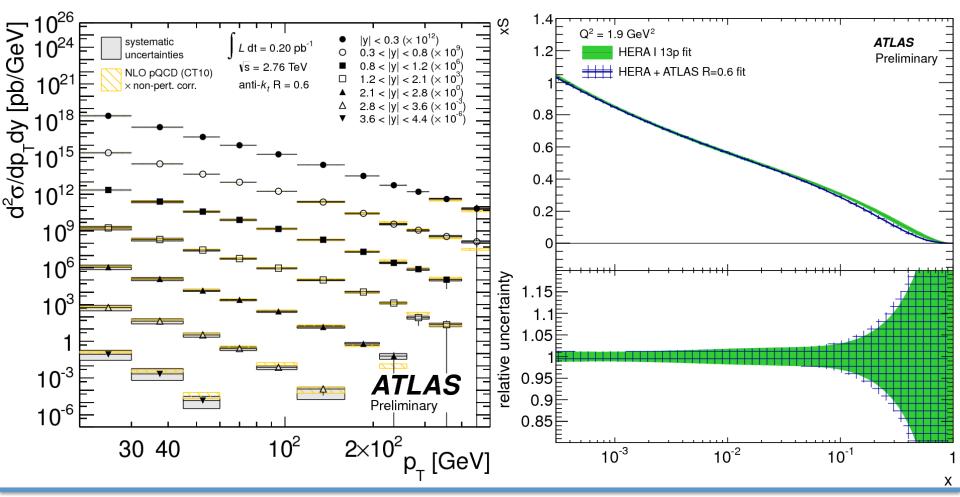

Cross-Sections and $\rm PDFs^{\tiny CMS-PAS-QCD-11-004}$

- Inclusive cross sections are now feeding into PDF determination, particularly at very low x and high Q^2
 - Note that 2011 data are still preliminary (unpublished!)
- This is always a slower process than a new physics search
 - No indication of any BSM physics here!
- Expect 8 TeV results next year to further constrain PDFs

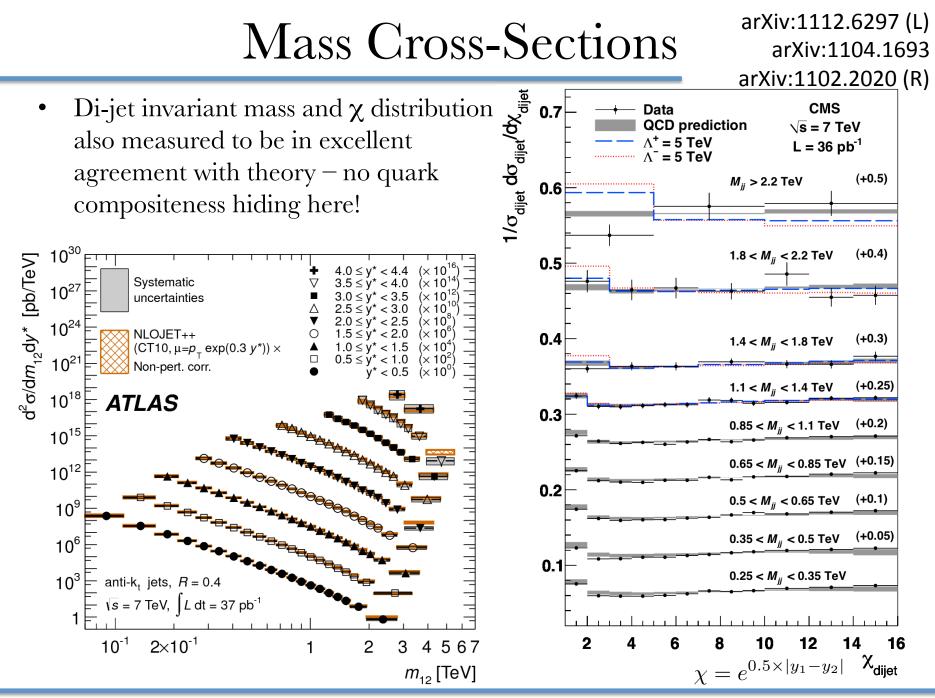

PDFs at Several Energies

- Now we've run at four center of mass energies (0.9, 2.76, 7.0, 8.0 TeV)
- All the different energies allow significant PDF constraints with our jet measurements and more energies will come after the shut down!

Multiplicity Distributions arXiv:1107.2092 (L) arXiv:1106.0647 (R)

• Multi-jet distributions are *very* pile-up sensitive, so unfolding the current data is quite difficult. But measurements with more data and multiplicities up to 10 are coming...

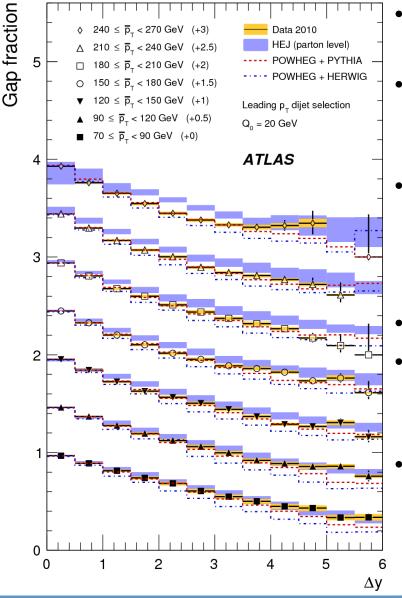

arXiv:1102.2696 (R) arXiv:1101.5029

 $\Delta \phi$ de-correlations must be well-10⁹ 1/σ dσ/dΔφ [radians⁻¹ **ATLAS** ∖s=7 TeV understood and well-modeled to anti-k_t jets R=0.6 $p_{-}>100 \text{ GeV}$ |y|<0.8 10⁸ Data $L dt = 36 \text{ pb}^{-1}$ trust many new physics searches 10^{7} $600 < p^{\text{max}} \le 800 \text{ GeV} (\times 10^7)$ Depend greatly on jet multiplicity $500 < p_{-}^{\text{max}} \le 600 \text{ GeV} (\times 10^6)$ 10⁶⊧ $400 < p_{-}^{\text{max}} \le 500 \text{ GeV} (\times 10^5)$ and splitting effects $310 < p_{-}^{\text{Tmax}} \le 400 \text{ GeV} (\times 10^4)$ 10⁵ $260 < p^{\text{Tmax}} \le 310 \text{ GeV} (\times 10^3)$ Tails also can depend on the 210< p^{max}≤ 260 GeV (×10²) modeling of backgrounds like $160 < \rho^{\text{max}} \le 210 \text{ GeV} (\times 10^{-1})$ 10⁴ $110 < p_{-}^{\text{max}} \le 160 \text{ GeV} (\times 10^{\circ})$ $Z \rightarrow \nu \nu + jets$ ⁺₽₽₽₽₽₽ 10^{3} Again, excellent modeling, 10^{2} excellent agreement with pQCD ,-O-O-O-O-O-O-O 10 10 10^{-2} NLO pQCD $\left[O(\alpha_s^4)\right]$ PDF & α unc. 10⁻³ ∭ scale unc. $\pi/2$ $2\pi/3$ $5\pi/6$ π $\Delta \phi$ [radians]

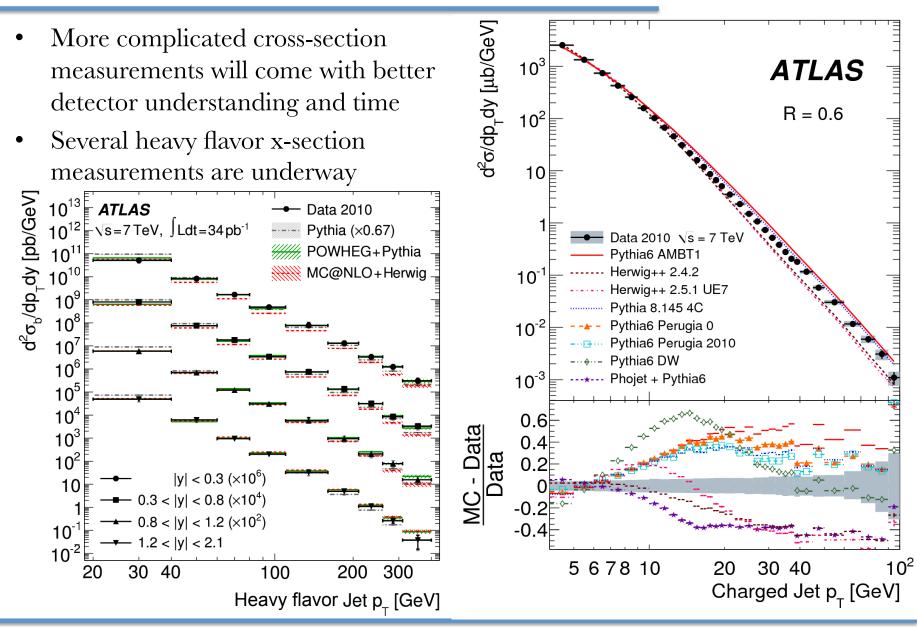

Rapidity Gaps

arXiv:1107.1641 (R) arXiv:1204.0696

- Fraction of events without a jet (with a gap)
 between the two highest-p_T jets
- Studies of wide-angle QCD and soft-scale
 gluon emissions, help with modeling for
 gluon fusion-like variables
- Some differences are on the scale of thedifference between Pythia and Herwigshowering, others slightly larger
 - Alpgen doesn't do well here, actually!
- Generally well modeled by Powheg+Pythia
- HEJ, parton-level only, presumably missing some parton shower effects that become important at high p_Ts
- BFKL-motivated generators generally don't do as nice a job of describing the data

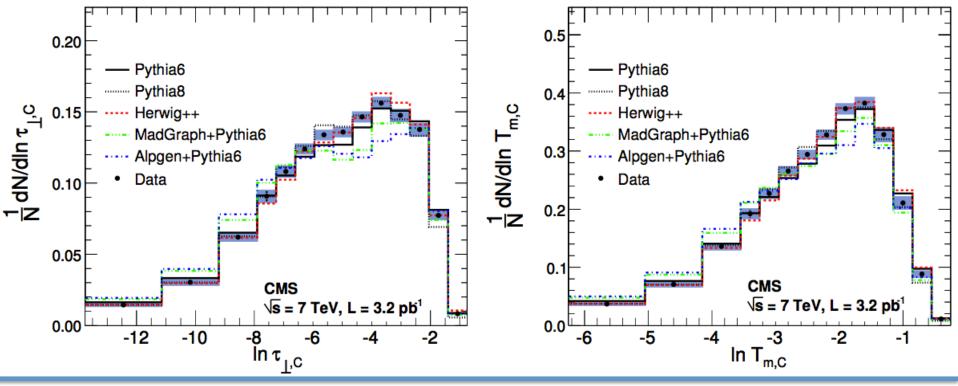

Alt. Cross-Section Views arXiv:1109.6833 (L) arXiv:1107.3311 (R)

Z Marshall - Experimental QCD; DESY 2012 Theory Workshop

Event Shapes

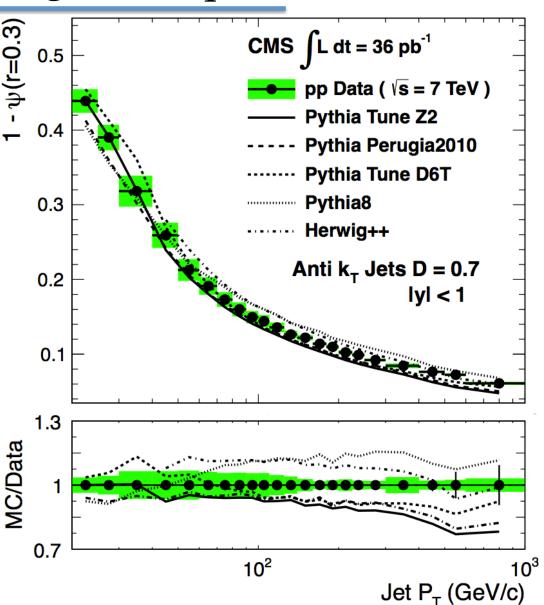

- Event shapes (major and minor thrust, sphericity, aplanarity, and third jet resolution parameter) measured in 2010 data
- Described *very* well by the standard MCs
- ATLAS sees far better agreement with Alpgen+Herwig
 - Indication of the sensitivity of these features to *tuning*. One cannot claim that Alpgen will do better *only* because it is $2 \rightarrow N$ in the matrix element!

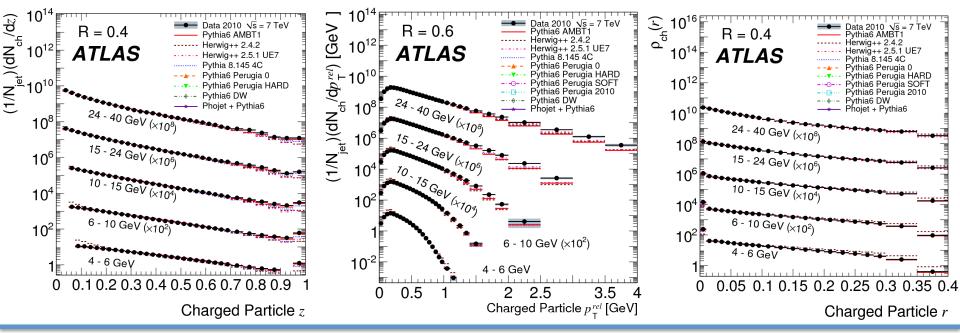

Classical Jet Shapes

- Extensive dictionary of jet shapes starting from radiusdependent energy densities as measured at the Tevatron
 - These shapes are sensitive to quark / gluon content, but they are more sensitive to the generator tune!
- Similar conclusions in ATLAS and CMS
 - Herwig++ too wide
 - Pythia too narrow
- These have already been fed back into the generator tunes
- With new tunes, the agreement is much improved
 - Little difference with different ME generators

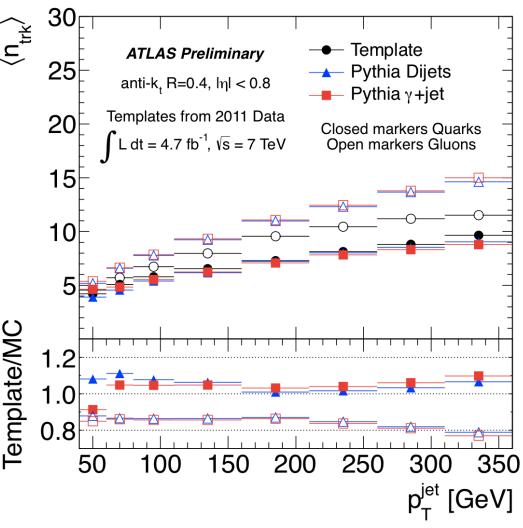

Jet Fragmentation Properties arXiv:1107.3311 arXiv:1109.5816 arXiv:1204.3170

- Fragmentation properties measured in occasional tour-de-force papers with many variables and distributions
 - Particle multiplicity, momentum fraction, relative p_T , and density in a jet
- These are really feeding into the numerical models (Pythia, Herwig, Sherpa, Powheg) that we use, and are mostly described well
- Still, we hope that theorists pay careful attention to models as they run out of parameters, are unable to describe the data, or model the data incorrectly in a way that might affect your favorite search / measurement

Properties for q/g Tagging

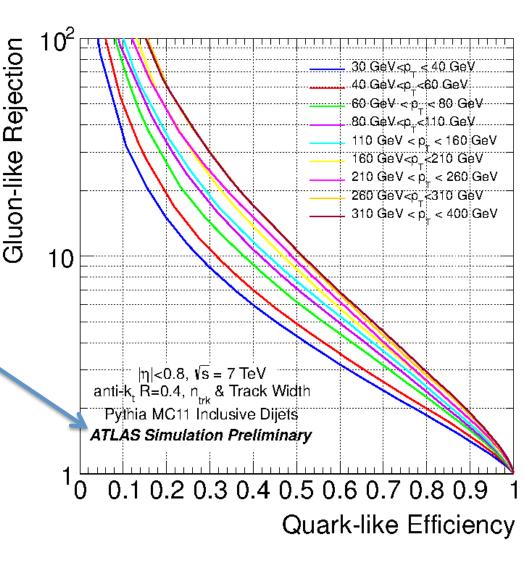

- Recent plots show why these are important, for example in a quark / gluon discriminant
- Very popular in modern Higgs searches / measurements
- Standard MC (Pythia here) *drastically* overestimates the discriminating power between quarks and gluons
- Far reaching implications on:
 - Jet energy scale and uncertainty
 - Tagging / discrimination
 - Potential measurements of quark-enriched / gluonenriched samples

Web Only

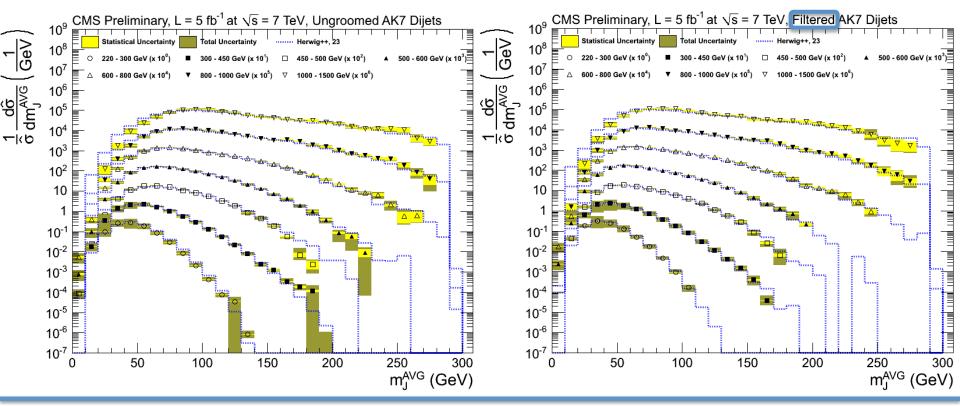

q/g Tagging Potential

- Recent plots show why these are important, for example in a quark / gluon discriminant
- Very popular in modern Higgs searches / measurements
- Standard MC (Pythia here) drastically overestimates the discriminating power between quarks and gluons
 - If the data looked like the MC, we could do quite a bit!
- Far reaching implications on:
 - Jet energy scale and uncertainty
 - Tagging / discrimination
 - Potential measurements of quark-enriched / gluonenriched samples

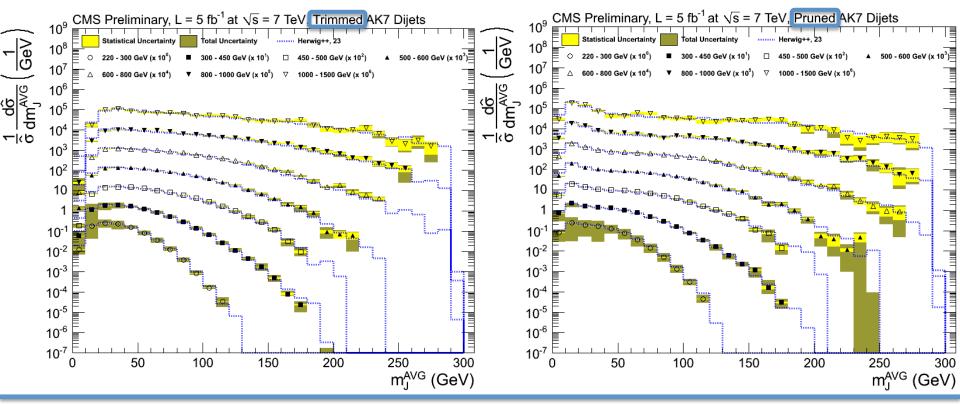

Jet Masses

- Jet masses now measured in larger cone jets (R=0.7, 1.0, 1.2)
- Masses are more sensitive to edge effects and pile-up than p_T
- New algorithms to reduce the sensitivity (filtering, pruning, trimming) have been introduced and tested by both experiments good MC agreement, generally
- Both experiments can say that they do indeed help with pile-up, but without any new physics discovered, it is hard to say if any help in the discovery of new physics!

Jet Masses

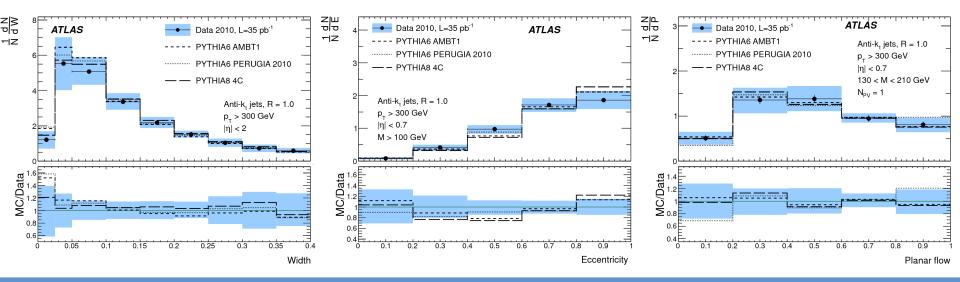

- Jet masses now measured in larger cone jets (R=0.7, 1.0, 1.2)
- Masses are more sensitive to edge effects and pile-up than p_T
- New algorithms to reduce the sensitivity (filtering, pruning, trimming) have been introduced and tested by both experiments good MC agreement, generally
- Both experiments can say that they do indeed help with pile-up, but without any new physics discovered, it is hard to say if any help in the discovery of new physics!

Fat Jets (for Searches)

arXiv:1206.5369 arXiv:1203.4606 CMS-PAS-QCD-10-041

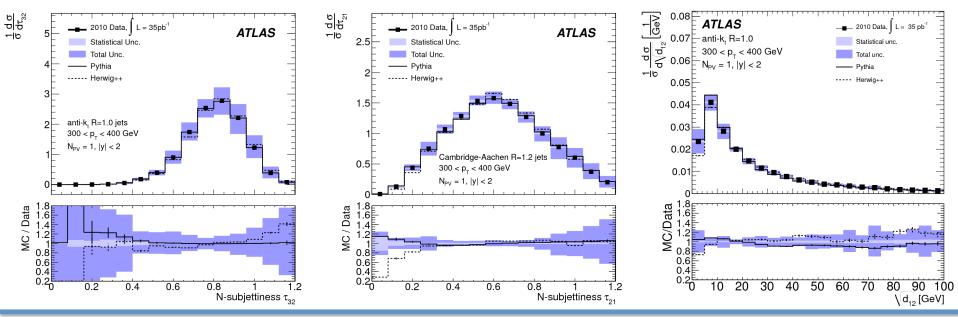

- When heavy objects are boosted, they end up as a single fat jet
 - Fat jets are usually radii >1.0, anti- k_t or Cambridge/Aachen algorithms
 - Can capture an entire W-boson or top quark in one jet
- Have to be sure that QCD is well-modeled to use these for boosted objects
- Validated a large set now as tools for ATLAS and CMS
 - Planar flow, angularity, width, eccentricity, n-subjettiness, subjet multiplicity
 - Pile-up is still a major complication; both experiments have tested various filtering algorithms, as well as some other techniques (e.g. complimentary cone)

Fat Jets (for Searches)

arXiv:1206.5369 arXiv:1203.4606 CMS-PAS-QCD-10-041

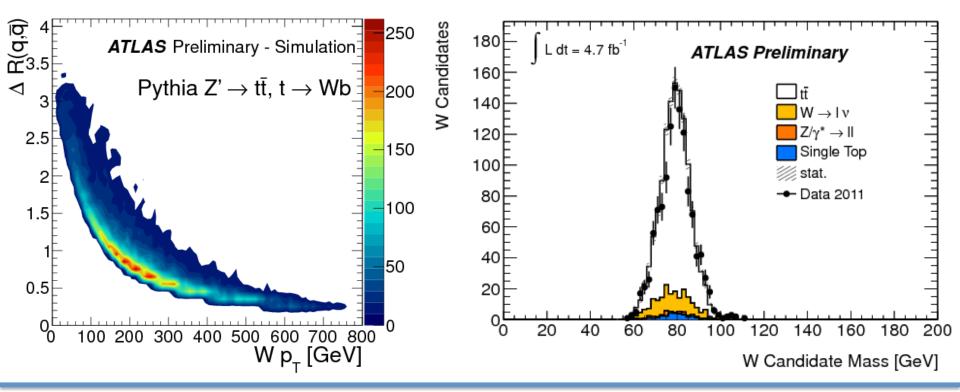

- When heavy objects are boosted, they end up as a single fat jet
 - Fat jets are usually radii >1.0, anti- k_t or Cambridge/Aachen algorithms

Z Marshall - Experimental QCD; DESY 2012 Theory Workshop

Fat Jets (For Measurements?)

- Procedures in place to find fat jets (R=1.5) with familiar-looking structure
- First, apply these to searches for massive particles (some results already out!)
- Next thing is to try to measure the Standard Model using these tools
 - Boosted W/Z, boosted Higgs, boosted top...

arXiv:1102.1957 Jets in Heavy Ion Collisions arXiv:1102.1957 arXiv:1202.5022 arXiv:1205.5872

- Heavy ions present a *much* more difficult environment for jet studies, but the ۲ payoff can be significant
- Jet suppression in heavy ion collisions was named one of the top 10 results ٠ from 2010
- Perhaps a sign of a quark/gluon plasma, but only if we understand the jets! ٠

CMS Experiment at LHC, CERN Data recorded: Sun Nov 14 19:31:39 2010 CEST Run/Event: 151076 / 1328520 Lumi section: 249 Jet 0, pt: 205.1 GeV Jet 1, pt: 70.0 GeV

Heavy Ion Jet Suppression arXiv:1208.1967 arXiv:1011.6182

Z Marshall - Experimental QCD; DESY 2012 Theory Workshop

Summary

- QCD measurements at the LHC are already rich and precise
 But they always lag the searches by a bit it takes time to understand the detectors and data in such fine detail!
- The standard measurements of inclusive spectra are done
 - Some interesting modifications, like particle production inside of jets
- Now we are on to more exciting things!
 - Radius-dependence of jet cross-sections
 - Very high-multiplicity (N>8, N>10?) final state measurements
 - Fat jet performance in preparation for new search methods
- The old Monte Carlo methods are holding up surprisingly well
 Pythia always does better than anticipated, after tuning especially
- We welcome new developments from our theorist friends
 - Always happy to test new Monte Carlos and tunes
 - Very happy to test new jet properties / structure variables if they might give us some improvement in new physics reach or be interesting alone
