

Good software practice

Thursday 11 October 2012 11:00 (1h 30m)

This course will give an introduction to code source management tools (e.g. subversion and mercurial) and value their use in everyday coding. Further, different aspects of coding style are discussed upon real-life examples. For working effectively with larger scale projects, testing and compilation should be a one-step process during the project build. This talk will also introduce the tools and methods provided by cmake/ctest.
