Status AII Development

Ronald Starink

PDP Group, NIKHEF

Quattor Workshop - DESY, 18-20 October 2006

- Various bug fixes
- Some enhancements:
    - Support for rescue images
    - Support for alternative device naming schemes

- In progress:
  - Separate site configuration from component configuration
  - Error handling
  - Complete partitioning scheme
  - Documentation
  - Schema change for block devices
- Still to start:
  - SPMA proxy support
  - Support for Sindes

- Currently pro_software_component_aii* abused
  - Generic component configuration
  - AND site-specific configuration
  - Installed in read-only area, so sites require copy
    - Painful to maintain when new release comes

- Development version:
  - pro_software_component_aii:
    - True software component
    - Installed by rpm
  - pro_declaration_component_aii:
    - Function aiiconfig(name, disk) to return configuration
    - Installed by rpm
  - pro_config_aii_site:
    - Site-specific configuration
    - Part of user configuration
    - Example installed by rpm
  - pro_config_aii_*NAME* (pro_config_aii_centos3_i386):
    - OS / arch specific configuration
    - Part of user configuration
    - Example installed by rpm

- Near future: backward incompatible release!
  - Separation of configuration
  - Change in schema for generic block devices
- Short on staff, short on time
  - No improvement expected in near future
- Feature Requests:
  - Develop your own solution?
  - Test on your configuration...
    - Anyway needed for more exotic requests / services
