based on work together with Thomas Gehrmann and Lorenzo Tancredi:

JHEP 08 (2013) 070 ([arXiv:1306.6344](#))

What is diboson production?

The production of two electroweak gauge bosons ($\gamma, W^{+,-}, Z$)

- ▶ Background for Higgs boson searches, Beyond the Standard Model (BSM) Physics searches
- ▶ Study of electroweak symmetry breaking, unitarization of $W_L W_L$ scattering
- ▶ Indirect probe for new physics

Diboson production at leading order

Example: Production of a $W^+ W^-$ pair

Triple Gauge Coupling: modified by New Physics?

Triple Gauge Couplings

- ▶ Probe for physics above the LHC scale (i.e. a few TeV)
- ▶ present couplings: modified by BSM physics?
- ▶ new couplings: generated by BSM physics?
- ▶ in general: modifications very small

We need

- ▶ to study distributions
- ▶ precise measurements and predictions

Triple Gauge Couplings

Influence of a modified ZWW coupling

Leading lepton p_T
distribution in WW
events at the LHC
(CMS) [1306.1126]

Status of higher order computations

- ▶ **Electroweak corrections:** done at NLO for all processes

[Accomando et al. (2005), Bierweiler et al. (2013)]

- ▶ **QCD NLO:** done for all processes

[Ohnemus et al. (1993), Baur et al. (1993,1998), Dixon et al. (1998,1999)]

- ▶ **QCD NNLO:**

- ▶ complete: only $\gamma\gamma$

[Catani et al. (2012)]

- ▶ MINLO / VBFNLO approximation: WZ

[Campanario & Sapeta (2012)]

Ingredients of the NNLO computation

- ▶ **double-real** corrections:
known for all processes
- ▶ **real-virtual** corrections: known
for all processes [Dittmaier, Kallweit,
Binoth, Campanario, ...]
- ▶ **virtual** corrections:
 - ▶ $\gamma\gamma$ [Bern et al. (2001)]
 - ▶ $W\gamma$ and $Z\gamma$
[Gehrmann, Tancredi, Weihs (2012/13)]
 - ▶ WW (high energy limit)
[Chachamis et al. (2008)]

NNLO virtual contributions for two equal-mass particles

- ▶ write down **Feynman diagrams** (143 for $q\bar{q} \rightarrow ZZ$)

NNLO virtual contributions for two equal-mass particles

- ▶ write down **Feynman diagrams** (143 for $q\bar{q} \rightarrow ZZ$)
- ▶ computation of **tensor coefficients** using projectors

NNLO virtual contributions for two equal-mass particles

- ▶ write down **Feynman diagrams** (143 for $q\bar{q} \rightarrow ZZ$)
- ▶ computation of **tensor coefficients** using projectors
- ▶ Result: ≈ 4600 **scalar integrals**, classified into 3 topologies

Topo A

Topo B

Topo C

Solution of the Integrals

- ▶ **derive relations among them** exploiting analytic structure, Lorentz covariance and symmetries
- ▶ **reduction to Master Integrals (MIs)** using Laporta's algorithm implemented in Reduze [Studerus, v. Manteuffel (2012)]

Topo A: 26 MIs Topo B: 13 Topo C: 16

- ▶ **solution of MIs:** Method of **differential equations**

[Kotikov (1991), Remiddi (1997), Remiddi, Gehrmann (2000)]

Idea:

derive differential equation for the integral with respect to external invariants

Solution of the Differential Equations

$$\frac{\partial}{\partial \mathbf{s}_\alpha} M_j(D, \mathbf{s}) = \sum_k A_k(D, \mathbf{s}) M_k(D, \mathbf{s}) + \textit{Inhom}.$$

Solution of the Differential Equations

$$\frac{\partial}{\partial s_\alpha} M_j(D, \mathbf{s}) = \sum_k A_k(D, \mathbf{s}) M_k(D, \mathbf{s}) + \text{Inhom.}$$

1. **expansion** in $\epsilon = \frac{1}{2}(4 - D)$
2. **decoupling** of differential equations
3. **solve** by Euler's method of variation of constants
4. **fix boundary conditions** by imposing regularity at pseudo-thresholds

Solution of the Differential Equations

$$\frac{\partial}{\partial s_\alpha} M_j(D, \mathbf{s}) = \sum_k A_k(D, \mathbf{s}) M_k(D, \mathbf{s}) + \text{Inhom.}$$

1. **expansion** in $\epsilon = \frac{1}{2}(4 - D)$
2. **decoupling** of differential equations
3. **solve** by Euler's method of variation of constants
4. **fix boundary conditions** by imposing regularity at pseudo-thresholds

Challenges

- ▶ Variable transformations
- ▶ Taking limits
- ▶ Analytical continuations

Solution of the Differential Equations

$$\frac{\partial}{\partial s_\alpha} M_j(D, \mathbf{s}) = \sum_k A_k(D, \mathbf{s}) M_k(D, \mathbf{s}) + \text{Inhom.}$$

1. **expansion** in $\epsilon = \frac{1}{2}(4 - D)$
2. **decoupling** of differential equations
3. **solve** by Euler's method of variation of constants
4. **fix boundary conditions** by imposing regularity at pseudo-thresholds

Challenges

- ▶ Variable transformations
- ▶ Taking limits
- ▶ Analytical continuations

Solution [C. Duhr]

Make use of algebraic structure of underlying functions!

Multiple Polylogarithms

- ▶ **Multiple Polylogarithms** (MPLs) are defined as iterated integrals:

$$G(a_1, \dots, a_n; x) \equiv \int_0^x \frac{dt}{t - a_1} G(a_2, \dots, a_n; t)$$

- ▶ Many curious properties, e.g. **shuffle product**

$$G(a_1, \dots, a_{n_1}; x) G(a_{n_1+1}, \dots, a_{n_1+n_2}; x) = \sum_{\sigma \in \Sigma(n_1, n_2)} G(a_{\sigma(1)}, \dots, a_{\sigma(n_1+n_2)}; x)$$

- ▶ They form an **algebra**
- ▶ Can be extended to a **Hopf algebra**, i.e. an algebra with additional structure: **coproduct** [A. B. Goncharov (2002)]

Idea for manipulating MPLs

[C. Duhr (2012)]

Transformations of MPLs are **complicated**

Idea for manipulating MPLs

[C. Duhr (2012)]

Transformations of MPLs are **complicated**

Translate the problem to an algebraic tensor product space

Idea for manipulating MPLs

[C. Duhr (2012)]

Transformations of MPLs are **complicated**

Translate the problem to an algebraic tensor product space

Transformations there are **simple**

Idea for manipulating MPLs [C. Duhr (2012)]

Transformations of MPLs are **complicated**

Translate the problem to an algebraic tensor product space

Transformations there are **simple**

Translate the result back to the function space

Algorithm is described in

[\[Anastasiou, Duhr et al. \(1302.4379\)\]](#),

[\[Gehrmann, Tancredi, Weihs \(1306.6344\)\]](#)

An example problem

Integration of

- ▶ Transform the differential equation from given in (z, y) to (z, x)
- ▶ obtain terms like

$$\int_0^z dz' \frac{1}{z' - x} G\left(0, -1, -2 - z'; y \rightarrow \frac{1 + x^2}{x} - z'\right)$$

Easy to integrate in terms of MPLs if their z' dependence is only $G(\dots; z')$!

Result

$$\begin{aligned}
 G\left(0, -1, -2 - z'; y \rightarrow \frac{1+x^2}{x} - z'\right) = & -G(0; x)^3/6 + (G(0; x)^2 G(J_X^{-1}; z'))/2 - G(J_X^{-1}; z')(2G(0, -1; x) \\
 & - 2G(-c, -1; x) + G(-c, 0; x) - 2G(-\bar{c}, -1; x) + G(-\bar{c}, 0; x)) \\
 & + G(-2; z')(-G(0; x)^2/2 + G(0, -c; x) + G(0, -\bar{c}; x) + G(-l, 0; x) \\
 & - (G(-c; x) + G(-\bar{c}; x))(G(-2, J_X^{-1}; z') - G(-1, J_X^{-1}; z')) \\
 & + G(J_X^{-1}, -2; z') - G(J_X^{-1}, -1; z')) + G(0; x)(G(-2, J_X^{-1}; z') \\
 & - G(-1, -2; z') + G(J_X^{-1}, -2; z') - G(J_X^{-1}, l_X^{-1}; z')) \\
 & \dots \\
 & - G(i, -\bar{c}, 0; x) - G(J_X^{-1}, -2, l_X^{-1}; z') + G(J_X^{-1}, -1, -2; z') \\
 & + G(J_X^{-1}, -1, l_X^{-1}; z') - G(J_X^{-1}, l_X^{-1}, -2; z') + \pi^2((-2G(-2; z') \\
 & - G(0; x) + G(-l; x) + G(i; x) + G(J_X^{-1}; z'))/12 - \log(2)/6) \\
 & + (-G(0; x)^2/2 + G(-1; z')(-G(0; x) + G(-l; x) + G(i; x)) \\
 & + (G(0; x) - G(-c; x) - G(-\bar{c}; x))G(J_X^{-1}; z') - G(-1, -2; z') \\
 & + G(-1, J_X^{-1}; z') + G(0, -c; x) + G(0, -\bar{c}; x) + G(-l, 0; x) \\
 & - G(-l, -c; x) - G(-l, -\bar{c}; x) + G(i, 0; x) - G(i, -c; x) \\
 & - G(i, -\bar{c}; x) + G(J_X^{-1}, -1; z') - G(J_X^{-1}, l_X^{-1}; z')) \log(2) \\
 & - (G(-1; z') \log(2)^2)/2 + (7\zeta(3))/8
 \end{aligned}$$

The “Coproduct enhanced symbol formalism”

- ▶ straightforward procedure

The “Coproduct enhanced symbol formalism”

- ▶ straightforward procedure
- ▶ possible to automatise

The “Coproduct enhanced symbol formalism”

- ▶ straightforward procedure
- ▶ possible to automatise
- ▶ it works!

Alternative formulation of an algebra using a tensor product

A “textbook” result from linear algebra

\mathcal{A} : a general algebra

$$G(a; x)G(b; x) = G(a, b; x) + G(b, a; x)$$

becomes

$$\mu(G(a; x) \otimes G(b; x)) = G(a, b; x) + G(b, a; x)$$

Alternative formulation of an algebra using a tensor product

Associativity

$$(a \cdot b) \cdot c = a \cdot (b \cdot c) \quad (a, b, c \in \mathcal{A})$$

becomes $(\beta \equiv \text{bilinear algebra multiplication})$

$$\begin{array}{ccc} \mathcal{A} \times \mathcal{A} \times \mathcal{A} & \xrightarrow{\text{id} \times \beta} & \mathcal{A} \times \mathcal{A} \\ \downarrow \beta \times \text{id} & & \downarrow \beta \\ \mathcal{A} \times \mathcal{A} & \xrightarrow{\beta} & \mathcal{A} \end{array}$$

Alternative formulation of an algebra using a tensor product

Associativity

$$(a \cdot b) \cdot c = a \cdot (b \cdot c) \quad (a, b, c \in \mathcal{A})$$

becomes $(\mu \equiv \text{linear tensor multiplication})$

$$\begin{array}{ccc} \mathcal{A} \otimes \mathcal{A} \otimes \mathcal{A} & \xrightarrow{\text{id} \otimes \mu} & \mathcal{A} \otimes \mathcal{A} \\ \downarrow \mu \otimes \text{id} & & \downarrow \mu \\ \mathcal{A} \otimes \mathcal{A} & \xrightarrow{\mu} & \mathcal{A} \end{array}$$

the Hopf-Algebra

A **Hopf algebra** \mathcal{H} has one more structure:

$$\begin{array}{ccc} \mathcal{H} \otimes \mathcal{H} \otimes \mathcal{H} & \xleftarrow{\text{id} \otimes \Delta} & \mathcal{H} \otimes \mathcal{H} \\ \uparrow \Delta \otimes \text{id} & & \uparrow \Delta \\ \mathcal{H} \otimes \mathcal{H} & \xleftarrow{\Delta} & \mathcal{H} \end{array}$$

Hopf algebra : \mathcal{H} **coproduct** : Δ

Δ is coassociative

\Rightarrow unique way to iterate the coproduct:

$$\mathcal{H} \xrightarrow{\Delta} \mathcal{H} \otimes \mathcal{H} \xrightarrow{\text{id} \otimes \Delta} \mathcal{H} \otimes \mathcal{H} \otimes \mathcal{H} \xrightarrow{\text{id} \otimes \text{id} \otimes \Delta} \dots$$

Hopf Algebra

Hopf algebra:

1. at the same time algebra (associative product)
2. and coalgebra (coassociative coproduct) (= **bialgebra**)
3. connected (the field over which the algebra is generated is included in the algebra)

- ▶ Product and coproduct are **not dual** any more!
- ▶ We require their **compatibility**

$$\Delta(a \cdot b) = \Delta(a) \cdot \Delta(b),$$

$$\text{with } (a_1 \otimes a_2) \cdot (b_1 \otimes b_2) \equiv (a_1 \cdot b_1) \otimes (a_2 \cdot b_2) .$$

the Multiple Polylogarithm Hopf Algebra

- ▶ This can be done for the MPLs [Alexander B. Goncharov, 2002]
- ▶ some examples for Δ :

$$\Delta(\ln z) = 1 \otimes \ln z + \ln z \otimes 1 ,$$

$$\Delta(\mathrm{Li}_n(z)) = 1 \otimes \mathrm{Li}_n(z) + \mathrm{Li}_n(z) \otimes 1 + \sum_{k=1}^{n-1} \mathrm{Li}_{n-k}(z) \otimes \frac{\ln^k z}{k!} .$$

Notation

- ▶ $\Delta_{2,1}$ = Apply coproduct; select tensors with weights $2 \otimes 1$.
- ▶ $\Delta_{1,1,1}$ = Apply coproduct two times; select tensors with weights $1 \otimes 1 \otimes 1$.

(obvious) observation

Equal expressions involving MPLs have an equal coproduct!
i.e. at weight 3:

$$F_3 = G_3$$

$$\Delta_{2,1}(F_3) = \Delta_{2,1}(G_3) \qquad \Delta_{1,2}(F_3) = \Delta_{1,2}(G_3)$$

$$\Delta_{1,1,1}(F_3) = \Delta_{1,1,1}(G_3)$$

Advantage: only identities of lower weight needed

An Algorithm to simplify/transform MPLs

[C. Duhr (2012)] :

compute the “symbol” $\Delta_{1,\dots,1}(F)$

integrate it in terms of MPLs (yielding G)

compute $\Delta_{2,1,\dots,1}(F - G)$, etc. to recover the parts lost by the symbol map ($\propto \pi^n, \zeta(n)$)

determine missing constant term using PSLQ algorithm or guess
