

# Recent BABAR results on $T$ , $CP$ AND $CPT$ symmetries

*DESY Seminars:*  
*Hamburg May 14<sup>th</sup>,*  
*Berlin May 15<sup>th</sup>*

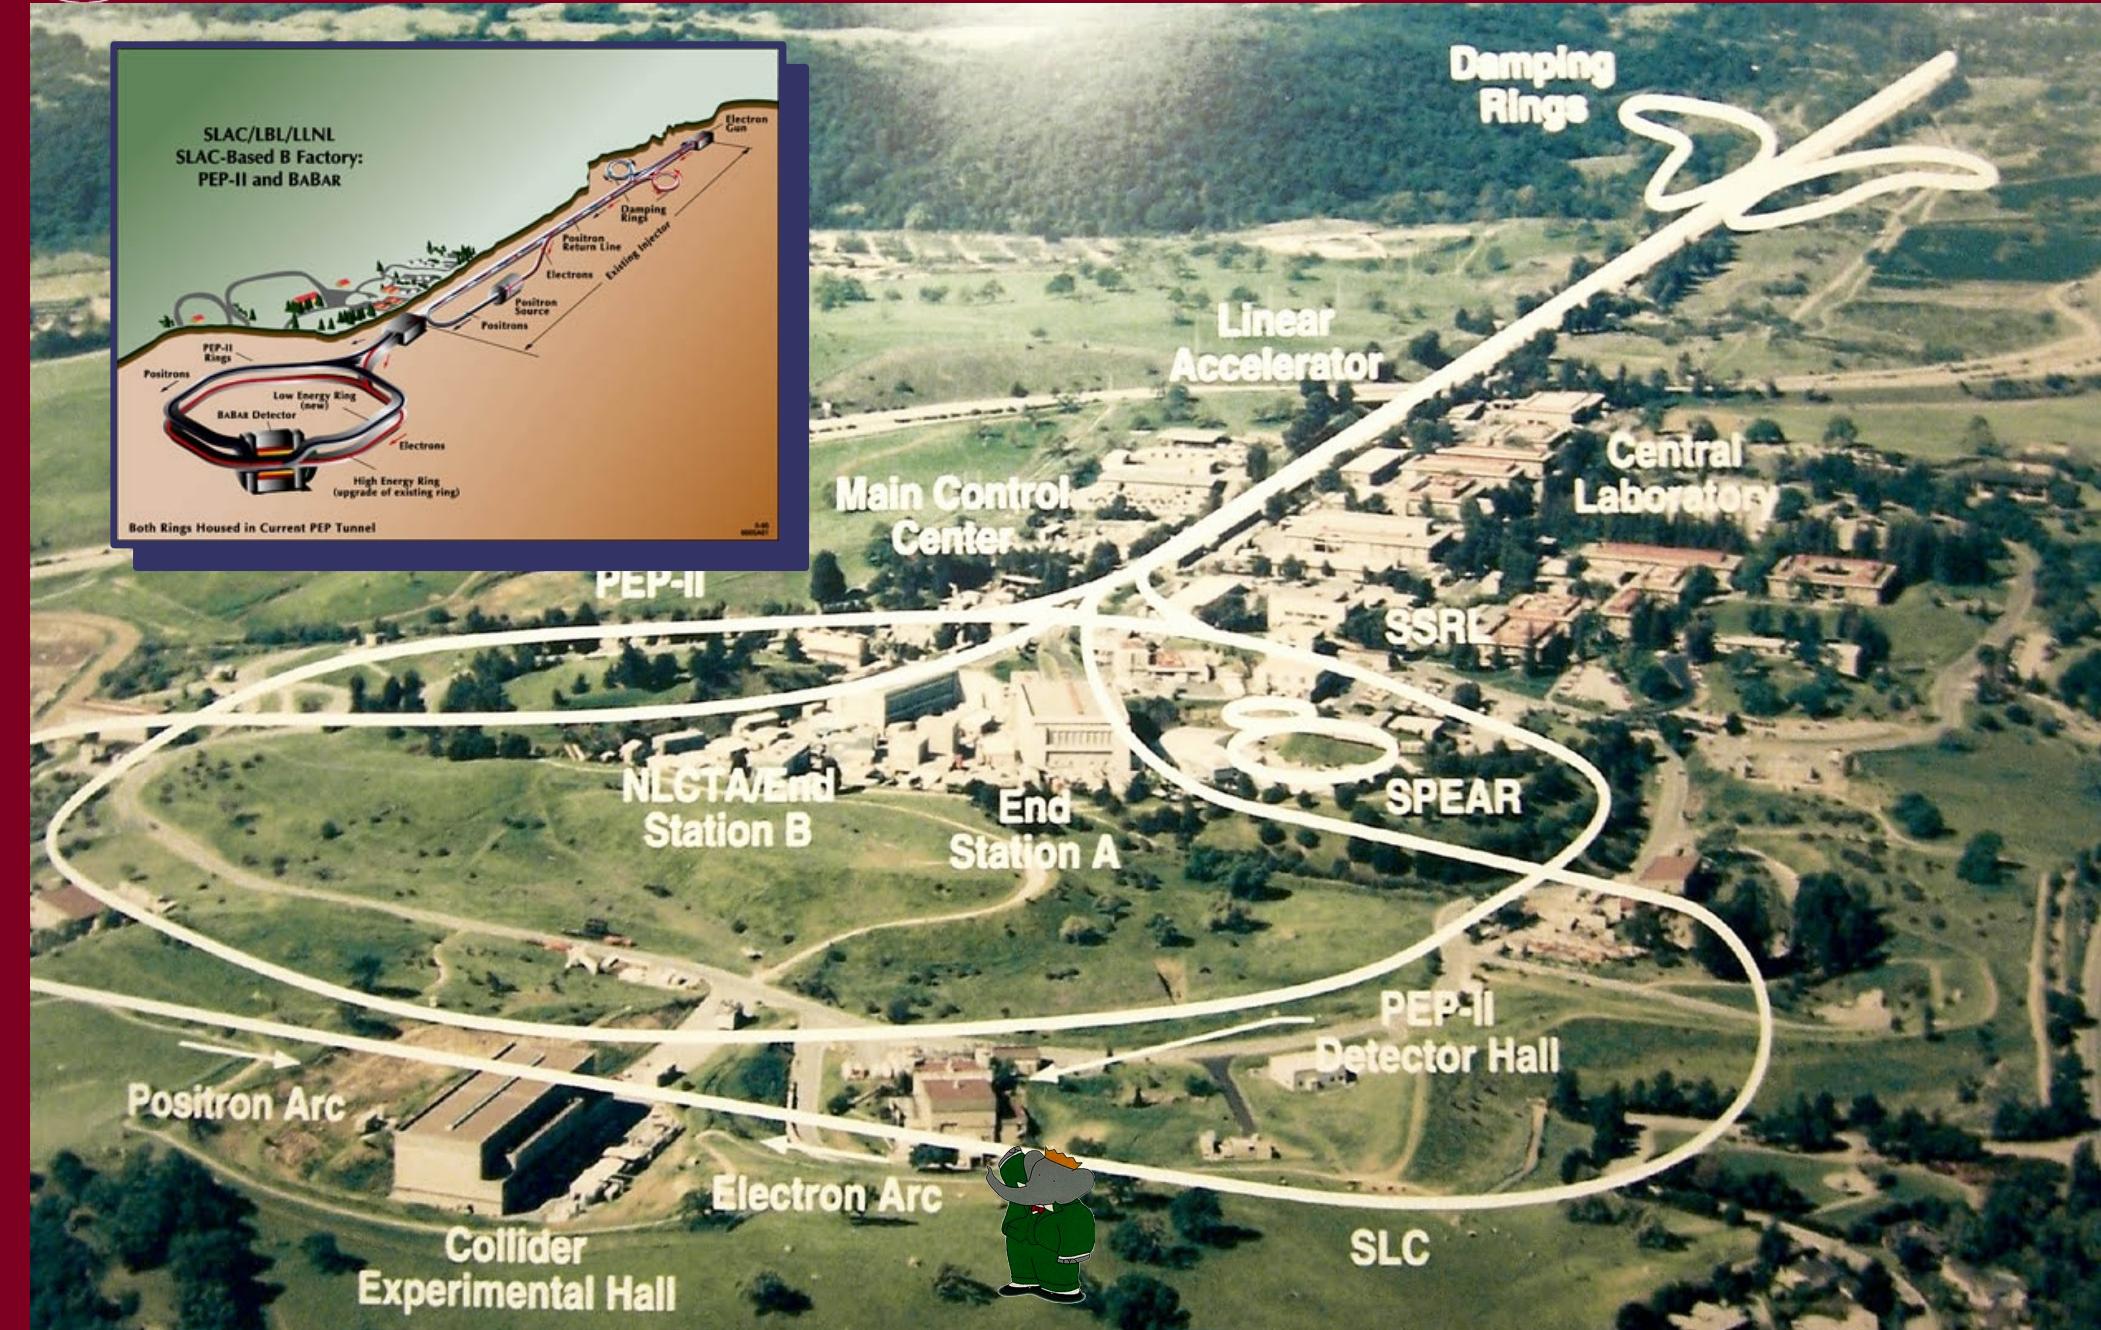

- Introduction : reminder of a success
- First direct observation of T symmetry violation in the evolution and decay of the  $B^0$  meson
- Search for mixing-induced CP violation with a new approach

22/10/1999 -> 07/04/2008 :

- 530 fb<sup>-1</sup> collected
- > 500 million  $B\bar{B}$ ,  $c\bar{c}$ ,  $\pi\bar{\pi}$  pairs
- 516 published papers

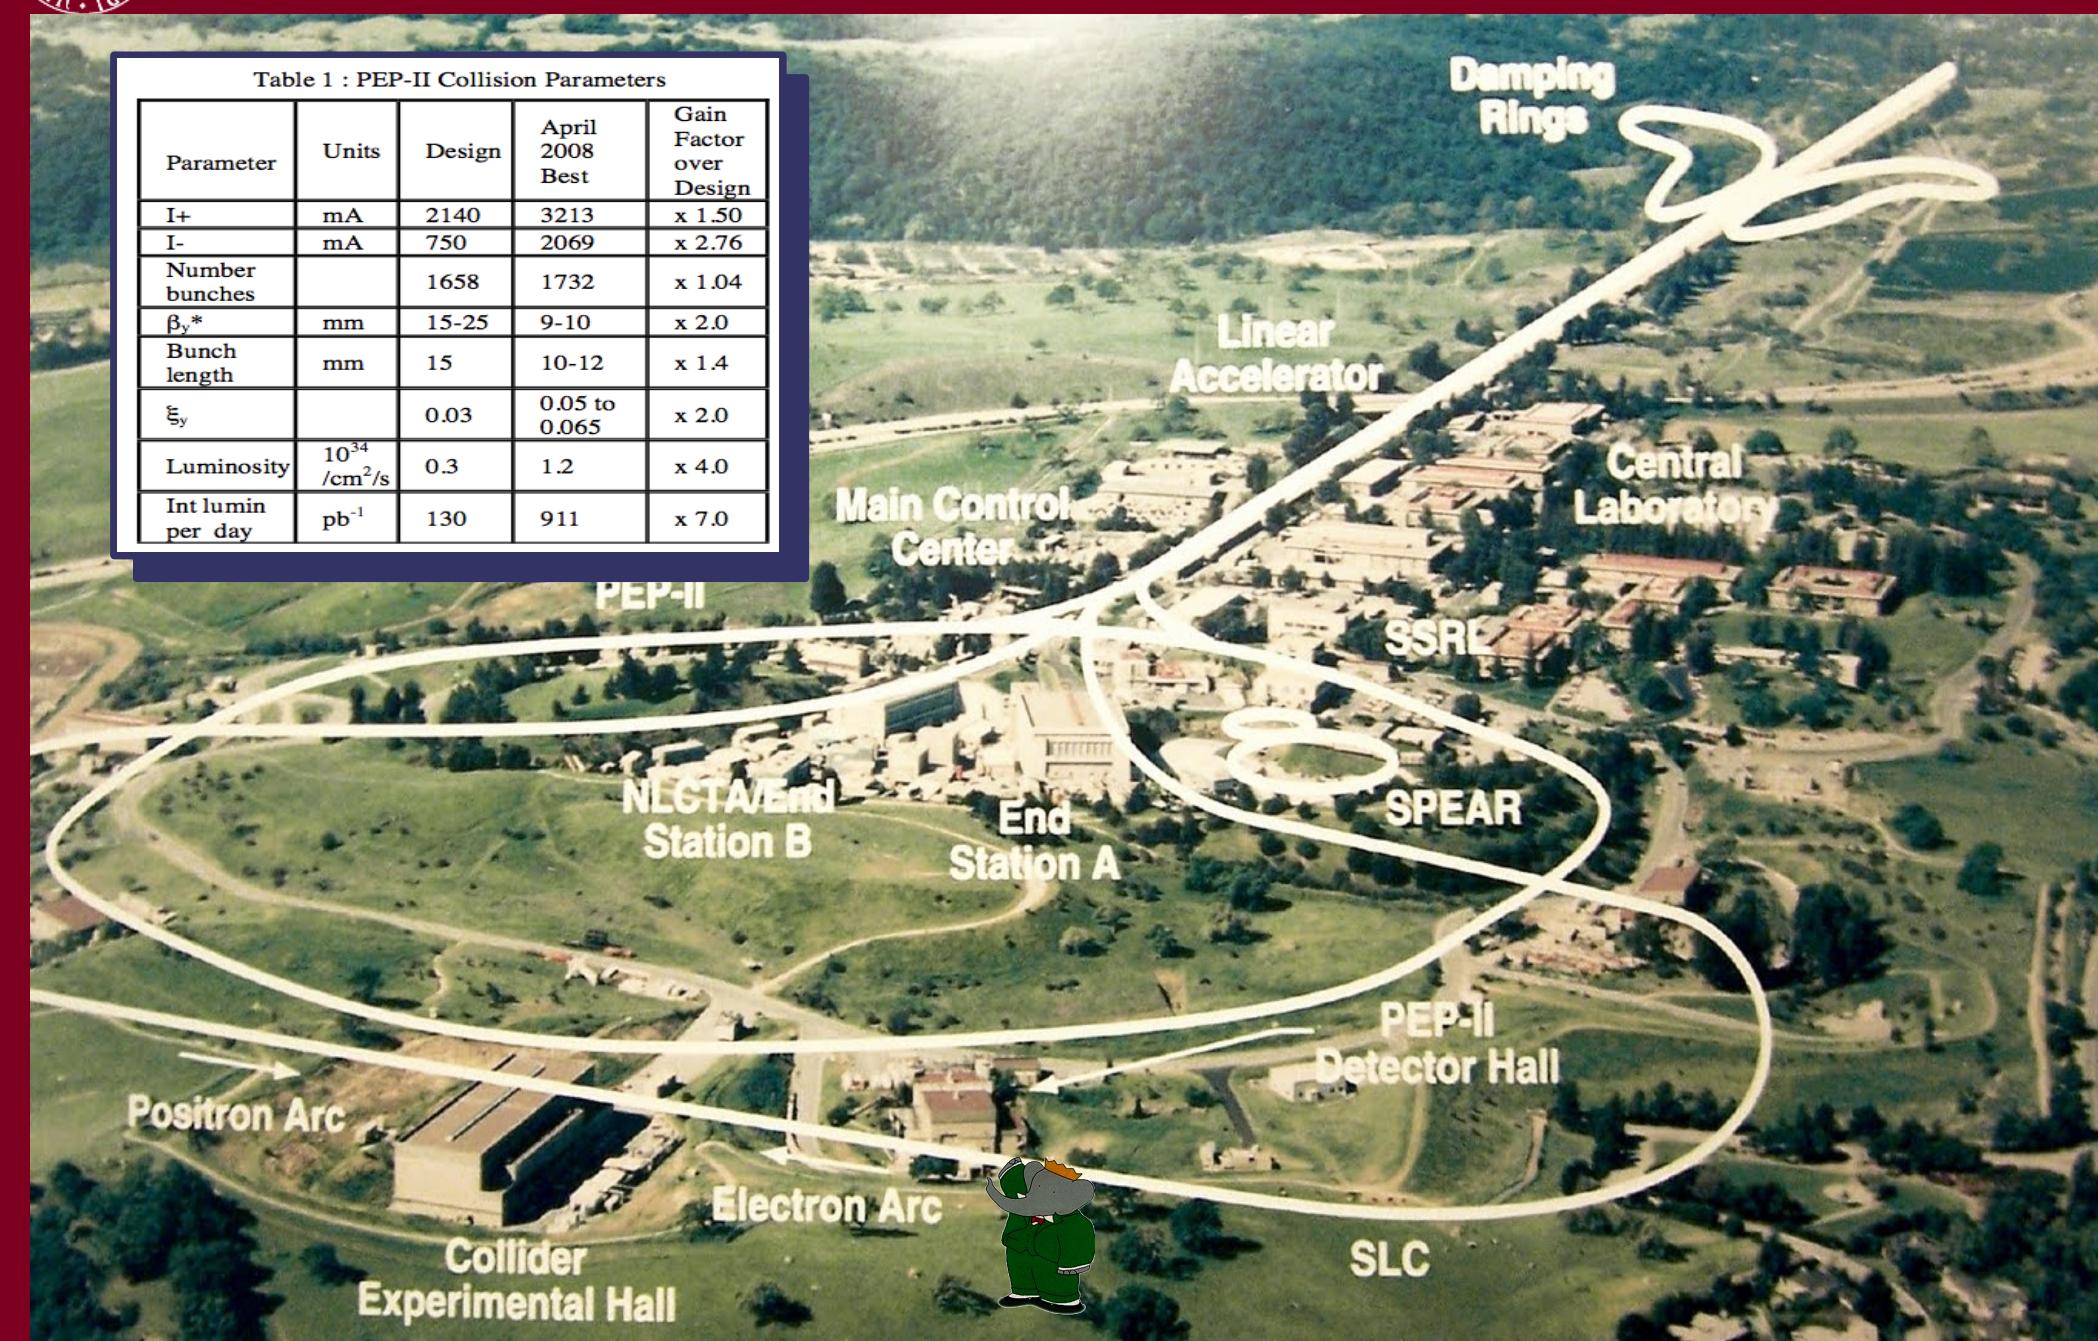

## Tools for a success : the factory

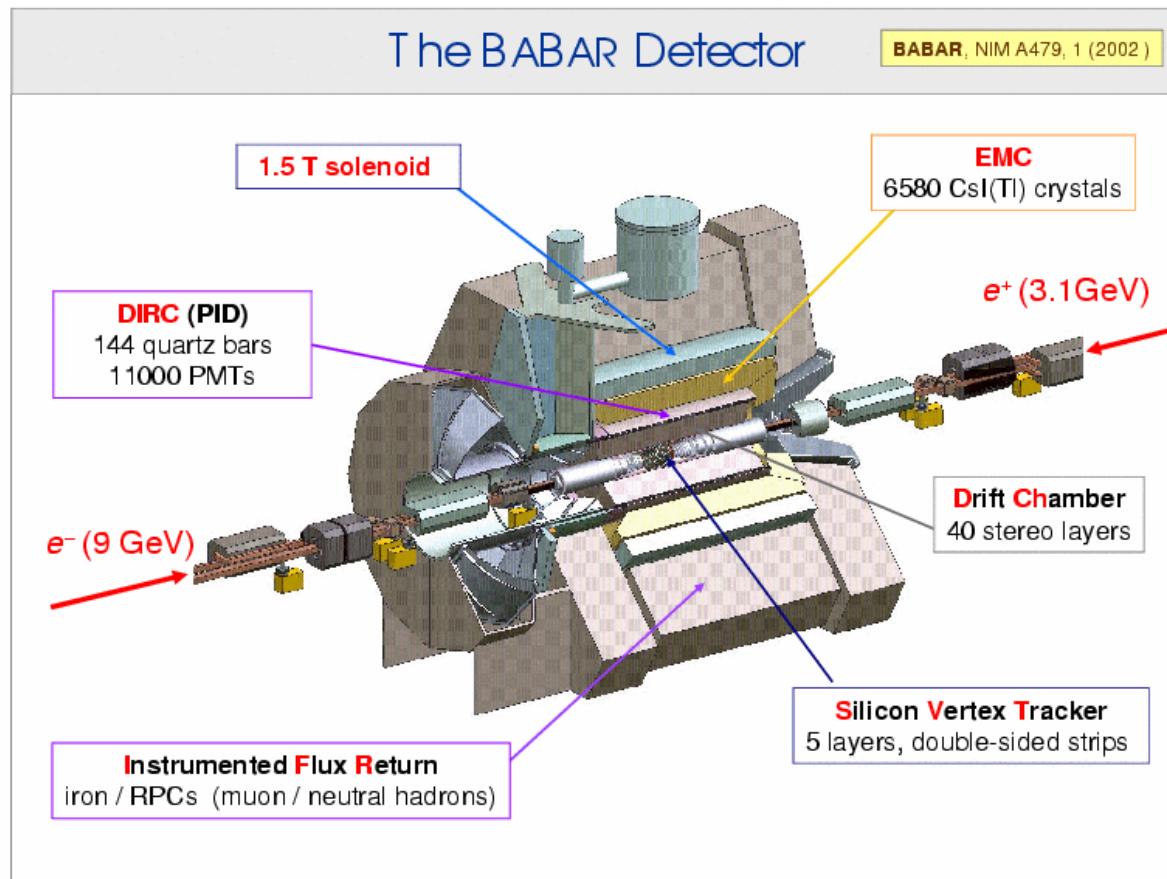

# Tools for a success : the factory

Table 1 : PEP-II Collision Parameters

Parameter	Units	Design	April 2008 Best	Gain Factor over Design
I+	mA	2140	3213	x 1.50
I-	mA	750	2069	x 2.76
Number bunches		1658	1732	x 1.04
$\beta_y^*$	mm	15-25	9-10	x 2.0
Bunch length	mm	15	10-12	x 1.4
$\xi_y$		0.03	0.05 to 0.065	x 2.0
Luminosity	$10^{34} /cm^2/s$	0.3	1.2	x 4.0
Int lumin per day	$pb^{-1}$	130	911	x 7.0

**Silicon Vertex Tracker :**

$$\sigma(\Delta Z)_{\text{VERTEX}} = 180 \mu m$$

**Tracking (SVT+DCH) :**

$$\sigma(P_T)/P_T = (0.13 P_T + 0.45)\%$$

**PID (dE/dx + DIRC) :**

$$\pi/K @ 4\sigma \quad (0.1 \rightarrow 4 GeV)$$

**EMC :**

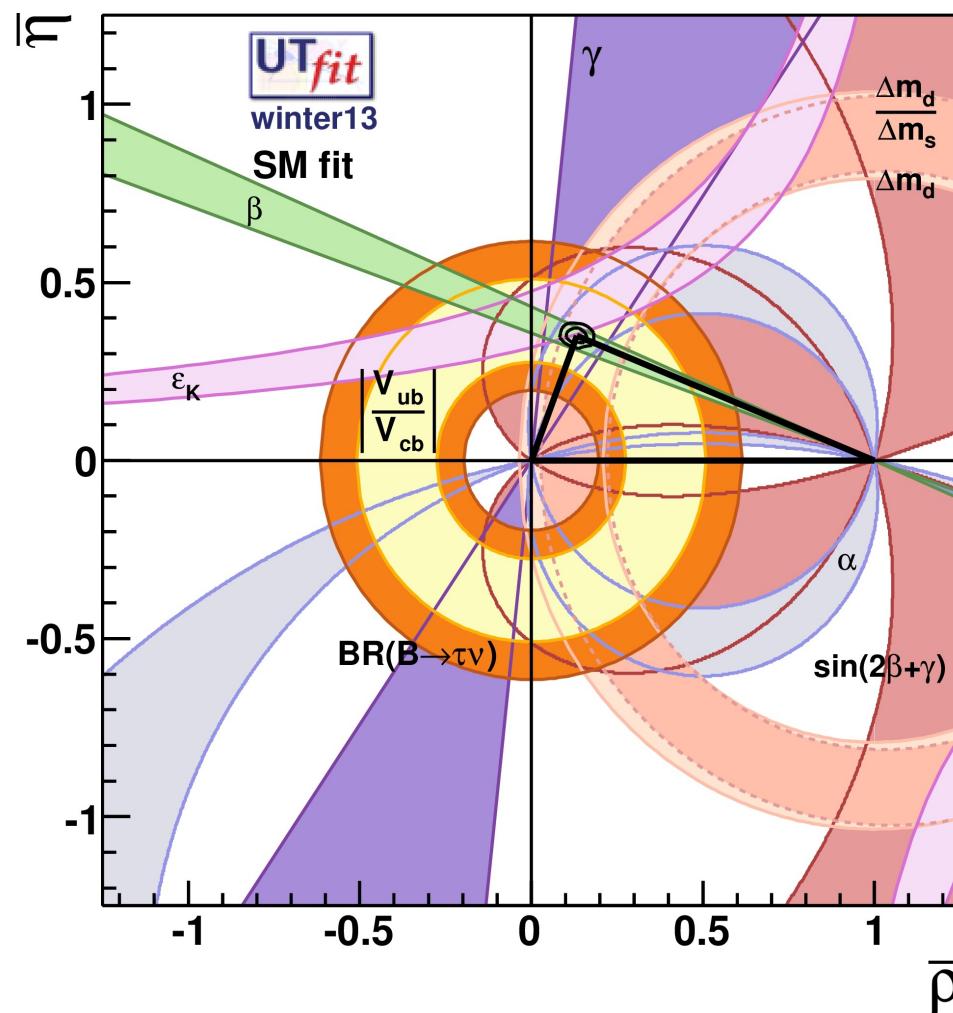

$$\sigma(E)/E = 2.3 E^{-1/4} \oplus 1.85\%$$

**Instrumented Flux Return :**

$$\epsilon_\mu \simeq 70\%$$

$$\epsilon_{\pi, K \rightarrow \mu} \simeq 2\%$$

$\theta, \phi$  for hadron showers

- Fit to unitary triangle confirms Cabibbo-Kobayashi-Maskawa mechanism as sole source of CP-violation in hadron system evolution and decay

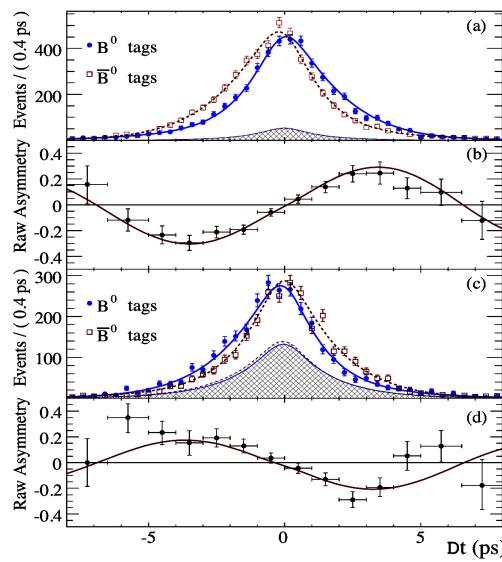

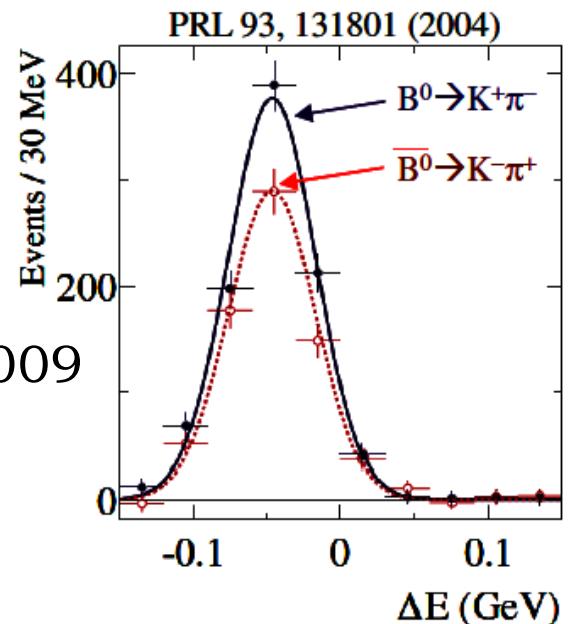

- First Observation of Direct CPV :

$$\Gamma(B \rightarrow f) \neq \Gamma(\bar{B} \rightarrow \bar{f})$$

$$\frac{\Gamma(\bar{B}^0 \rightarrow K^- \pi^+) - \Gamma(B^0 \rightarrow K^+ \pi^-)}{\Gamma(\bar{B}^0 \rightarrow K^- \pi^+) + \Gamma(B^0 \rightarrow K^+ \pi^-)} = -0.133 \pm 0.030 \pm 0.009$$

PRL 93.131801

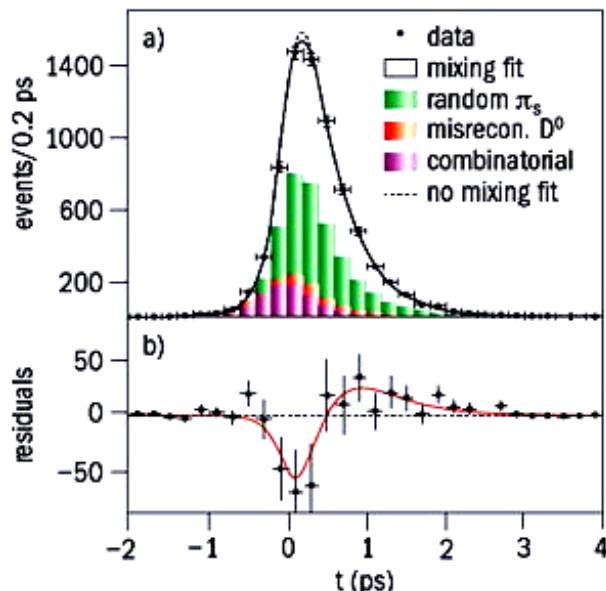

- CPV in interference of mixing and decay:

$$\sin(2\beta) = 0.666 \pm 0.031 \pm 0.013$$

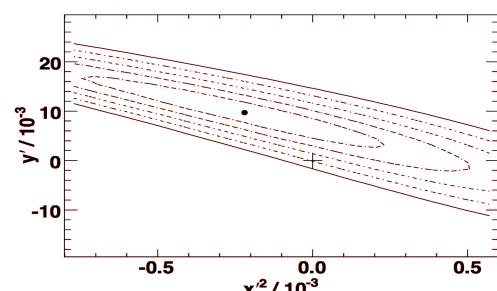

PRD 79 (2009) 072009

- First Observation of  $D^0$  oscillation

$$x'^2 = [-0.22 \pm 0.30(\text{stat.}) \pm 0.21(\text{syst.})] \times 10^{-3}$$

$$y' = [9.7 \pm 4.4(\text{stat.}) \pm 3.1(\text{syst.})] \times 10^{-3}$$

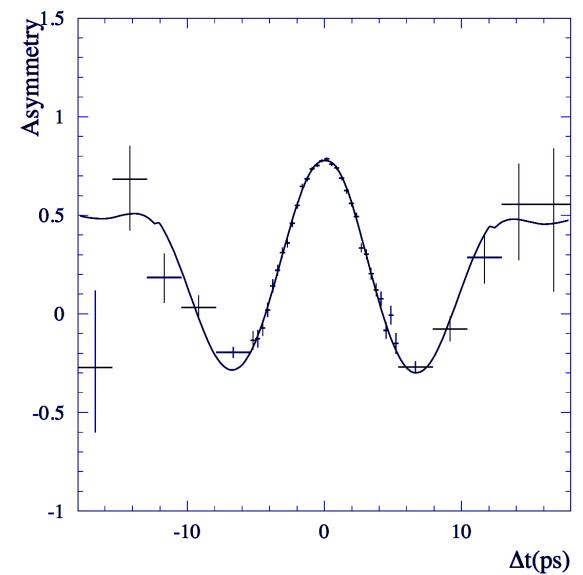

PRL 98, 211802

- Precise measurement of  $B^0$  oscillation frequency:

$$\tau_{B^0} = (1.504 \pm 0.013(\text{stat})^{+0.018}_{-0.013}(\text{syst})) \text{ ps}$$

$$\Delta m_d = (0.511 \pm 0.007(\text{stat})^{+0.007}_{-0.006}(\text{syst})) \text{ ps}^{-1}$$

PRD 73, 012004 (2006)

- Alive and well:
- Still 25 published papers in 2012
- plus 11 contributions (2012+2013) in reviewers hands
  - CPT in B mesons evolution and decay
  - CP in D mesons evolution and decay
  - rare B,D decays ;
  - $\tau$  lepton properties
  - search for light new particles ;
  - light hadron production in  $e^+e^-$  collisions ;
  - ...

- Alive and well:
- Still 25 published papers in 2012
- plus 11 contributions (2012+2013) in reviewers hands

- CPT in  $B$  mesons evolution and decay

- CP in  $D$  mesons evolution and decay
- rare  $B,D$  decays ;
- $\tau$  lepton properties
- search for light new particles ;
- light hadron production in  $e^+e^-$  collisions ;
- ...

- CP-V is well established
- CPT + CP-V  $\Leftrightarrow$  T Violation
  - (1.a) Can we assert T Violation independently of CPT assumption ?
  - (1.b) Can we test CPT in the B system ?
- CP in mixing has not yet been observed
  - (2) Can we improve wrt existing measurements ?

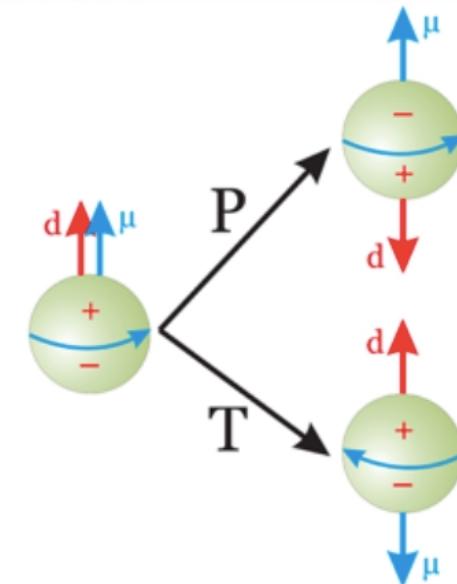

*PART I*

# Discovering T-Violation (and testing CPT)

# $T$ symmetry violation

- CP-Violation and CPT Theorem imply T-Violation in elementary systems
- Tests of T-V ignoring CPT-Th :
  - Electric Dipole Moment
 
$$\mathcal{D}_{Neutron} < 2.9 \cdot 10^{-28} \text{ em}$$

$$\mathcal{D}_{electron} = 7 \pm 7 \cdot 10^{-29} \text{ em}$$
  - $\nu_e \rightarrow \nu_\mu$  vs  $\nu_\mu \rightarrow \nu_e$   
 Needs long baseline, high  $\nu$  flux
  - in particle decays :  
 $|i\rangle \rightarrow |f\rangle$  vs  $|f\rangle \rightarrow |i\rangle$
  - in the evolution and decay of neutral unstable mesons

- Ideally compare two time-conjugate processes

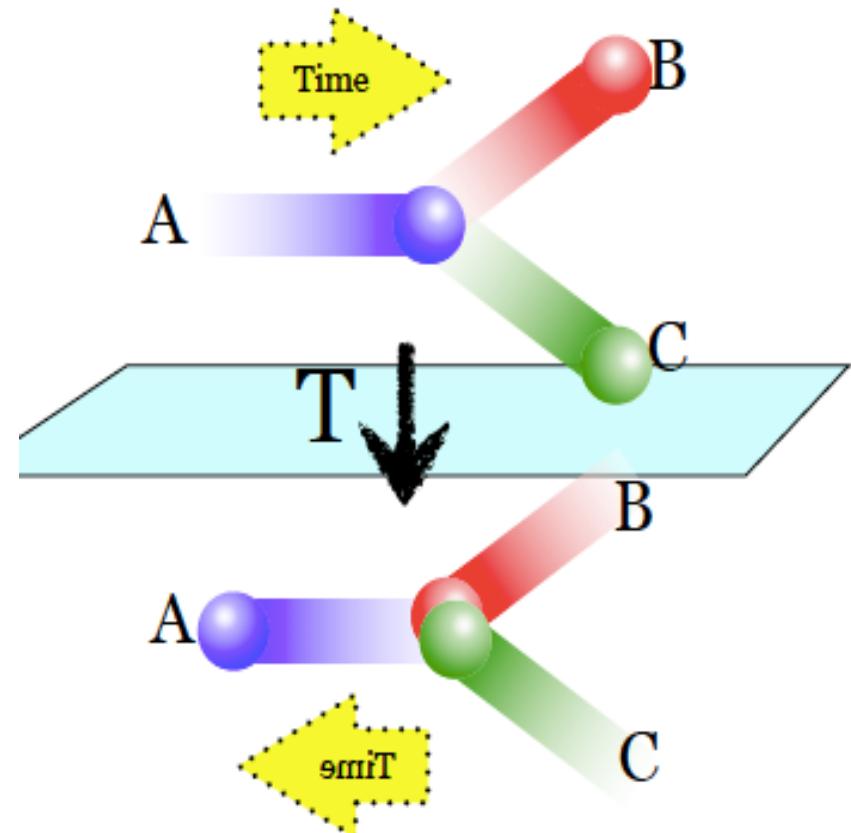

$$\mathcal{A}(B^0 \rightarrow K^+ \pi^-)$$

vs

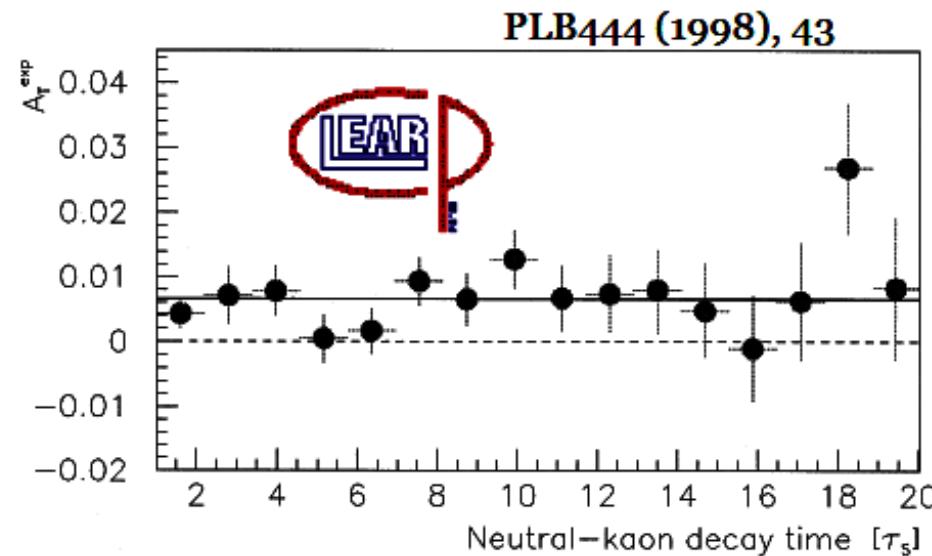

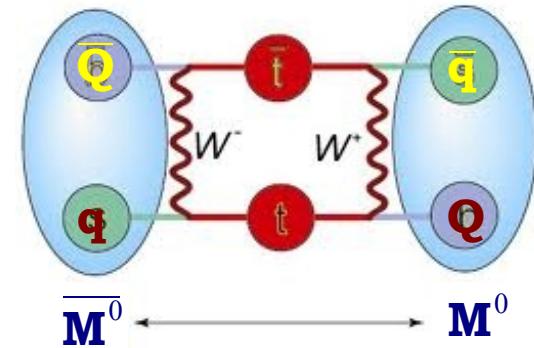

$$\mathcal{A}(K^+ \pi^- \rightarrow B^0)$$

- Unfeasible:

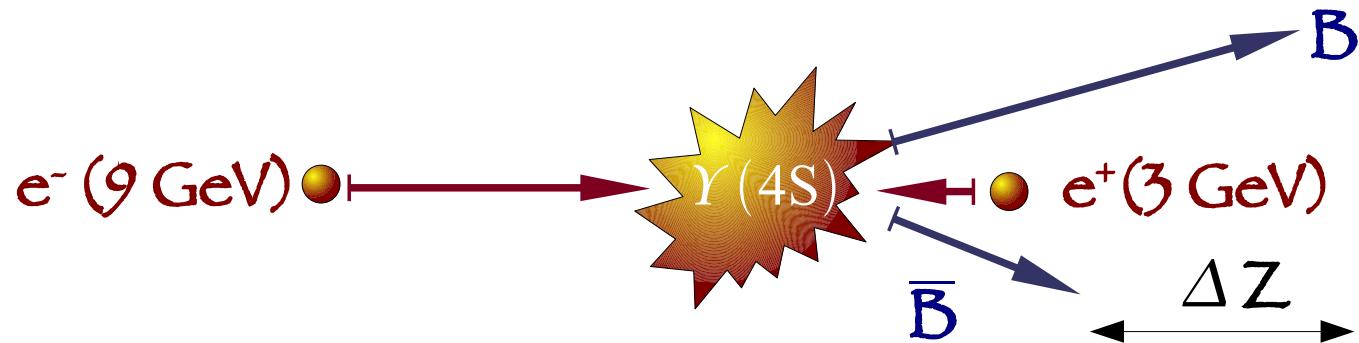

- collide  $K, \pi$  beams!
- tiny effects
- swamped by strong interactions

- Compare mixing rate for  $M^0 \rightarrow \bar{M}^0$  vs  $\bar{M}^0 \rightarrow M^0$
- Make (wise) use of time information to assess the role of T-violation
- Sole result (before BABAR):  $5\sigma$  effect @ CPLEAR

$$\left\langle \frac{R(\bar{K}_{t=0}^0 \rightarrow e^+ \pi^- \nu_{t=\tau}) - R(K_{t=0}^0 \rightarrow e^- \pi^+ \bar{\nu}_{t=\tau})}{R(\bar{K}_{t=0}^0 \rightarrow e^+ \pi^- \nu_{t=\tau}) + R(K_{t=0}^0 \rightarrow e^- \pi^+ \bar{\nu}_{t=\tau})} \right\rangle = (6.6 \pm 1.3_{\text{stat}} \pm 1.0_{\text{syst}}) \times 10^{-3}$$

- Boosted beams ( $\beta\gamma = 0.56$ ) allow measurement of proper time difference:  
$$\langle \Delta Z \rangle \sim \beta\gamma \tau c \sim 250 \mu\text{m}$$
- $M(4S) - 2M(B) \approx 10.5794 - 2 \cdot 5.279 < m_\pi$ 
  - $B\bar{B}$  pair constitutes an entangled quantum state, with same quantum numbers as  $Y(4S)$
  - Small  $B$  momentum in the transverse direction (< 340 MeV), mesons are boosted along the beam line

- In practice, exploit EPR entanglement in  $B\bar{B}$  production at  $\Upsilon(4S)$

$$e^+ e^- \rightarrow \Upsilon(4S) \rightarrow b\bar{b}$$

$J^{PC} = 1^{--}$

# Direct Measurement of $T$ Violation

- In practice, exploit EPR entanglement in  $B\bar{B}$  production at  $Y(4S)$

$$e^+ e^- \rightarrow Y(4S) \rightarrow b\bar{b}$$

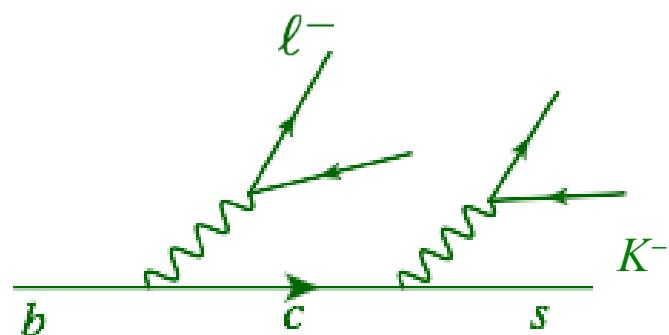

$$J^{PC} = 1^{--}$$

$$\rightarrow \frac{1}{\sqrt{2}}(|B^0(t_1)\bar{B}^0(t_2)\rangle - |B^0(t_2)\bar{B}^0(t_1)\rangle)$$

flavor eigenstate:  $B^0 = \begin{pmatrix} \bar{b} \\ d \end{pmatrix}$

- Flavor tagged with high efficiency by same means as CP analyses :

$$\begin{aligned}\bar{B}^0 &\rightarrow \ell^- X \\ \bar{B}^0 &\rightarrow K^- X \\ \bar{B}^0 &\rightarrow \pi_{\text{soft}}^+ X, \dots\end{aligned}$$

# Direct Measurement of $T$ Violation

- In practice, exploit EPR entanglement in  $B\bar{B}$  production at  $Y(4S)$

$$e^+ e^- \rightarrow Y(4S) \rightarrow b\bar{b}$$

$$J^{PC} = 1^{--}$$

$$\rightarrow \frac{1}{\sqrt{2}}(|B^0(t_1)\bar{B}^0(t_2)\rangle - |B^0(t_2)\bar{B}^0(t_1)\rangle)$$

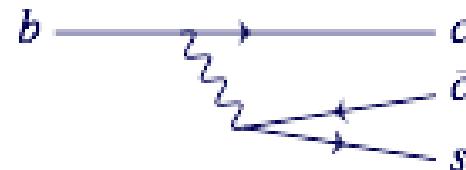

flavor eigenstate:  $B^0 = \begin{pmatrix} b \\ d \end{pmatrix}$

$$\rightarrow \frac{1}{\sqrt{2}}(|B_+(t_1)B_-(t_2)\rangle - |B_+(t_2)B_-(t_1)\rangle)$$

CP eigenstate:  $CP|B_{\pm}\rangle = \pm|B_{\pm}\rangle$

- $B_{+-}$  decay to CP +/- eigenstates (full reconstruction):

$$B_+ \rightarrow J/\psi K_L$$

$$B_- \rightarrow (c\bar{c})K_S$$

$J/\psi, \psi(2S), \chi_{c1}$

- In practice, exploit EPR entanglement in  $B\bar{B}$  production at  $\Upsilon(4S)$

$$e^+ e^- \rightarrow \Upsilon(4S) \rightarrow b\bar{b}$$

$$J^{PC} = 1^{--}$$

$$\rightarrow \frac{1}{\sqrt{2}}(\mathbb{I}\mathcal{B}^0(t_1)\overline{\mathcal{B}^0}(t_2) - \mathbb{I}\mathcal{B}^0(t_2)\overline{\mathcal{B}^0}(t_1))$$

flavor eigenstate:  $\mathcal{B}^0 = \begin{pmatrix} b \\ d \end{pmatrix}$

$$\rightarrow \frac{1}{\sqrt{2}}(\mathbb{I}\mathcal{B}_+(t_1)\mathcal{B}_-(t_2) - \mathbb{I}\mathcal{B}_+(t_2)\mathcal{B}_-(t_1))$$

CP eigenstate:  $CP|\mathcal{B}_\pm\rangle = \pm |\mathcal{B}_\pm\rangle$

- Perform 4 complementary tests:

$$\mathcal{B}_+ \rightarrow \mathcal{B}^0 \quad \text{vs} \quad \mathcal{B}^0 \rightarrow \mathcal{B}_+$$

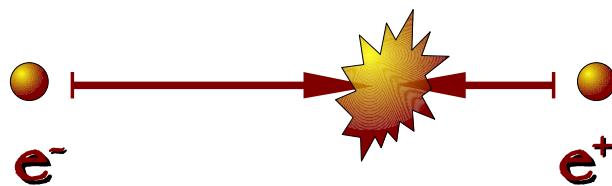

$$\mathcal{B}_- \rightarrow \mathcal{B}^0 \quad \text{vs} \quad \mathcal{B}^0 \rightarrow \mathcal{B}_-$$

$$\mathcal{B}_- \rightarrow \overline{\mathcal{B}^0} \quad \text{vs} \quad \overline{\mathcal{B}^0} \rightarrow \mathcal{B}_-$$

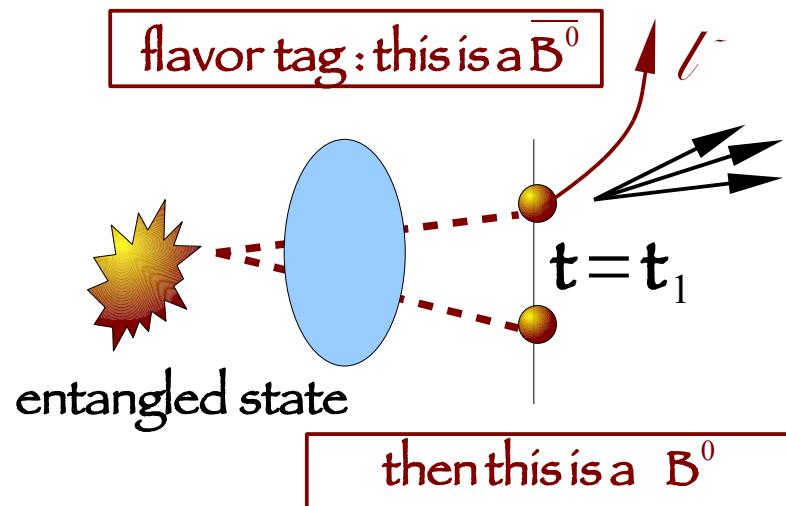

$$\mathcal{B}_+ \rightarrow \overline{\mathcal{B}^0} \quad \text{vs} \quad \overline{\mathcal{B}^0} \rightarrow \mathcal{B}_+$$

- ... plus INDEPENDENT tests of CPT and CP

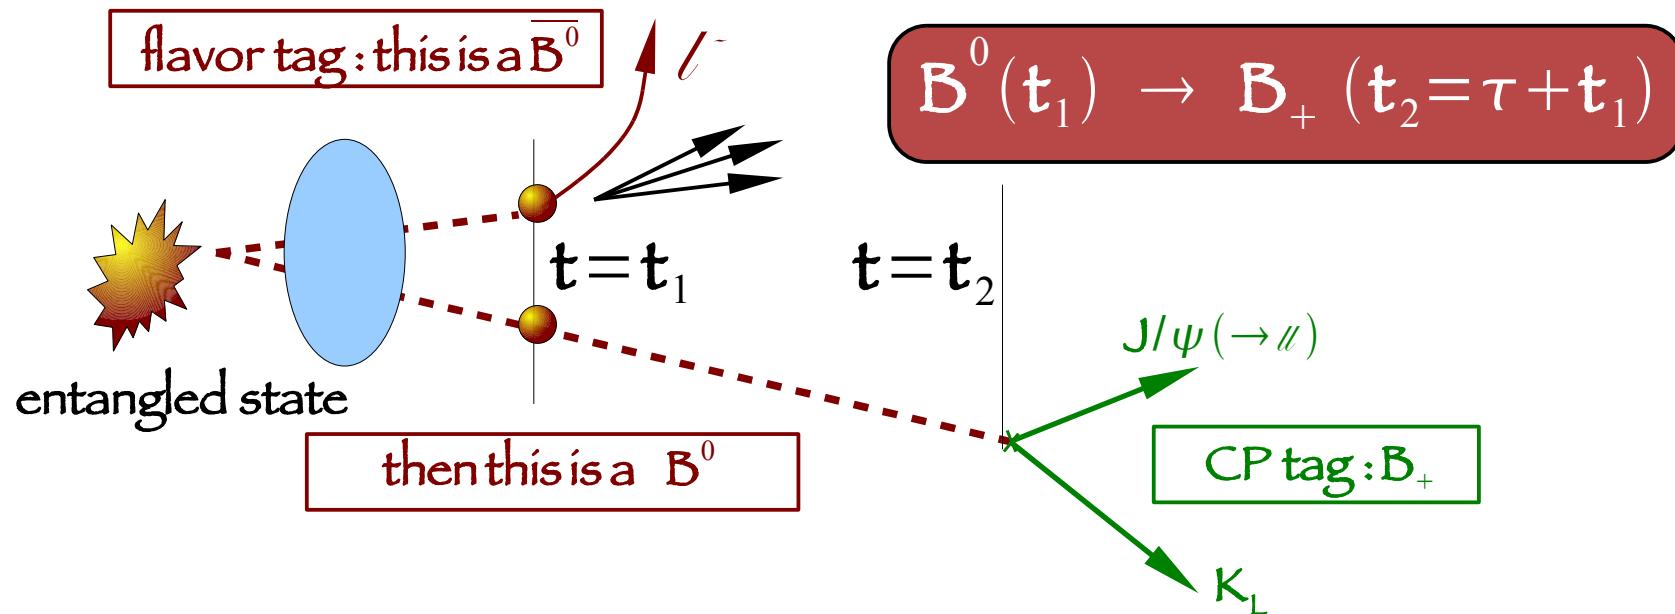

**boosted Y(4S) ( $\beta\gamma \approx 0.56$ )**

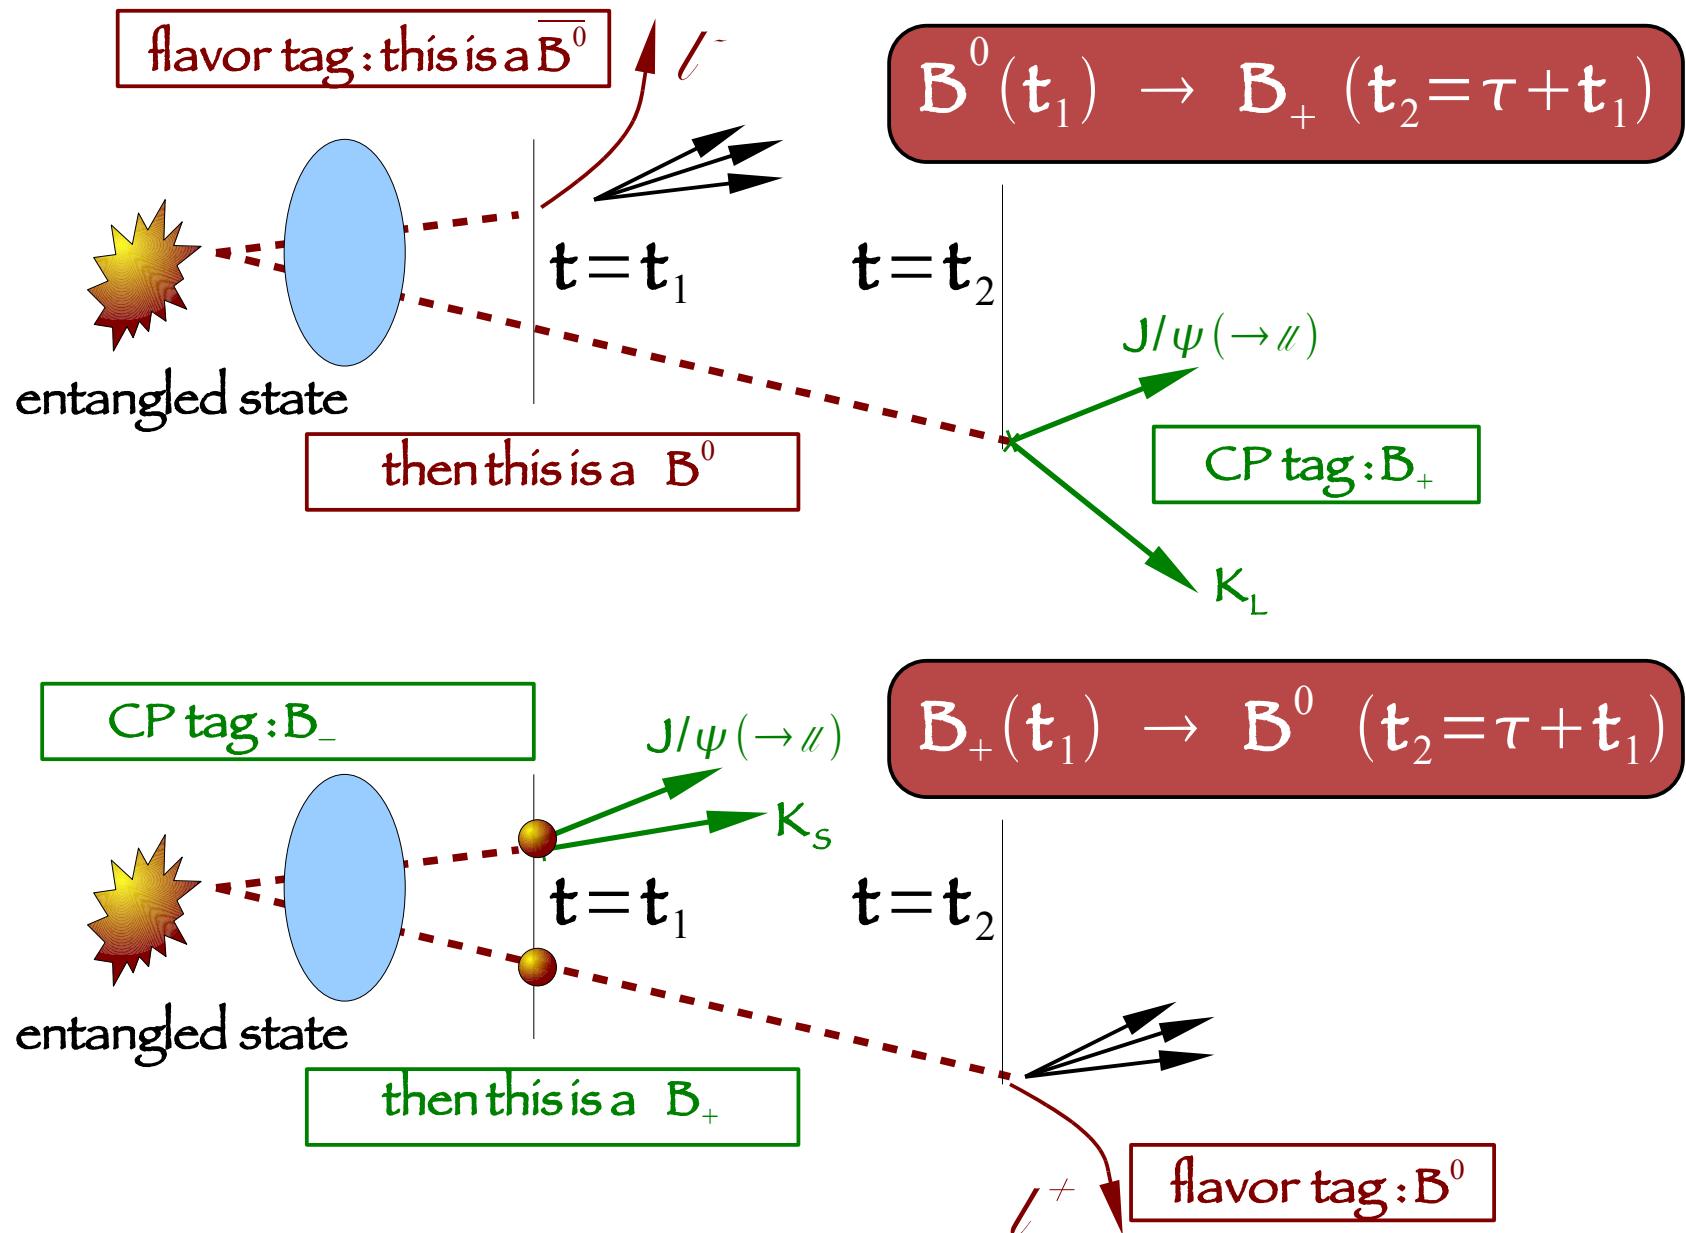

# T Analysis in a nutshell

# T Analysis in a nutshell

# $T$ Analysis in a nutshell

# TV analysis steps

- Define  $\Delta\tau = t(\text{flavor}) - t(\text{CP})$
- Consider eight combinations (flavor  $\times$  CP  $\times$  sign of  $\Delta\tau$ )
- Fit each with EPR-motivated function

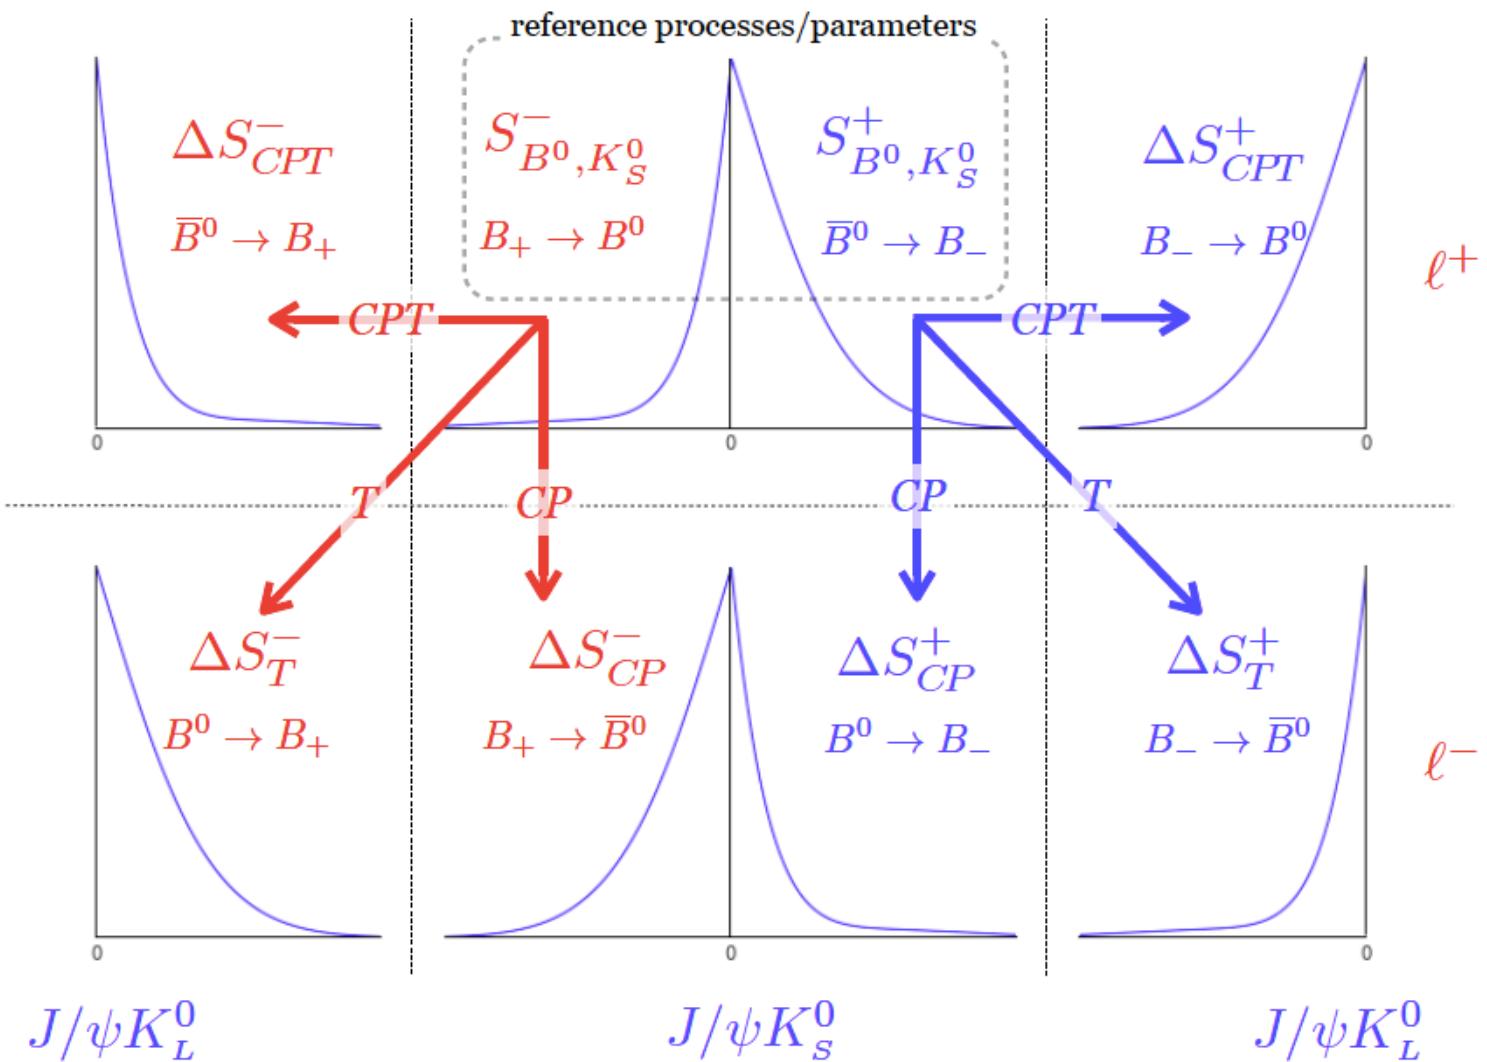

$$g_{\alpha,\beta}^{\pm}(\Delta\tau) \propto e^{-\Gamma|\Delta\tau|} \mathcal{H}(\pm\Delta\tau) [1 + S_{\alpha,\beta}^{\pm} \sin(\Delta m_d \Delta\tau) + C_{\alpha,\beta}^{\pm} \cos(\Delta m_d \Delta\tau)]$$

Heavyside step function

- $S_{\alpha\beta}^+$ ,  $C_{\alpha\beta}^+$ : fit parameters
  - T-Violation :  $\Delta S_T^+ = S_{B^0, K_L}^+ - S_{B^0, K_S}^+ \neq 0$
  - CP-Violation :  $\Delta S_{CP}^- = S_{B^0, K_L}^- - S_{B^0, K_S}^- \neq 0$
  - CPT-Violation :  $\Delta S_{CPT}^- = S_{B^0, K_S}^- - S_{B^0, K_L}^- \neq 0$

- Assuming CPT & CP fit results, expect :

$$\begin{aligned} S_{T,\alpha,\beta}^{\pm} &= \pm \sin(2\beta) \\ \Delta S_T^{\pm} &= 2 \sin(2\beta) \end{aligned}$$

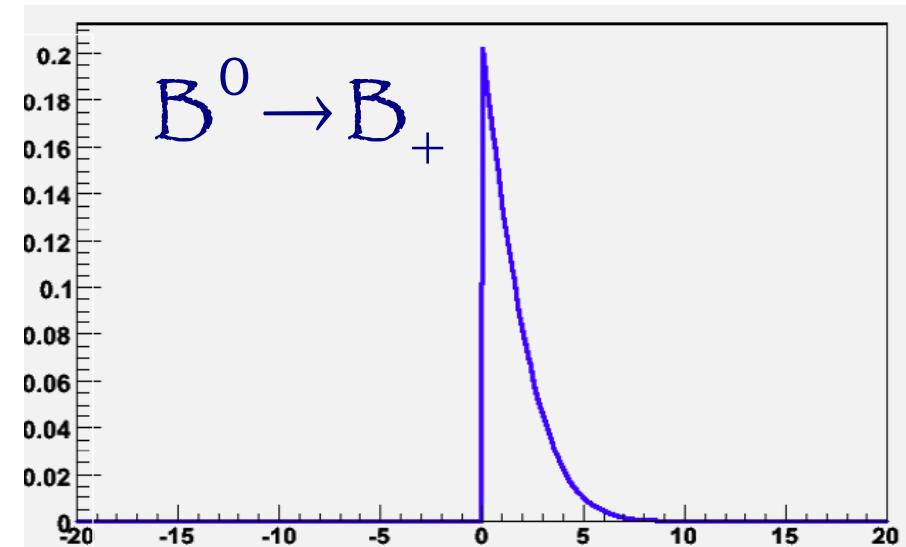

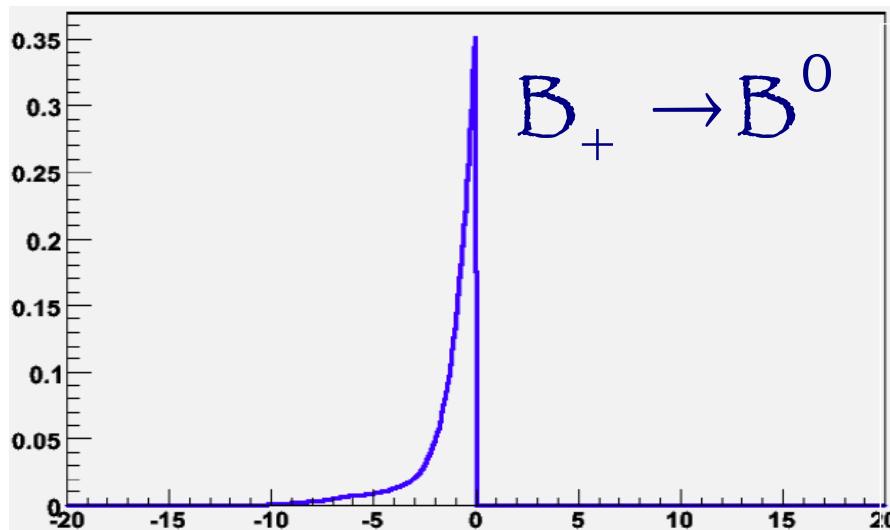

# TV analysis steps

- Define  $\Delta\tau = t(\text{flavor}) - t(\text{CP})$
- Consider eight combinations (flavor ( $\alpha$ )  $\times$  CP ( $\beta$ )  $\times$  sign of  $\Delta\tau$ )
- Fit each with EPR-motivated function

$$g_{\alpha,\beta}^{\pm}(\Delta\tau) \propto e^{-\Gamma|\Delta\tau|} \mathcal{H}(\pm\Delta\tau) [1 + S_{\alpha,\beta}^{\pm} \sin(\Delta m_d \Delta\tau) + C_{\alpha,\beta}^{\pm} \cos(\Delta m_d \Delta\tau)]$$

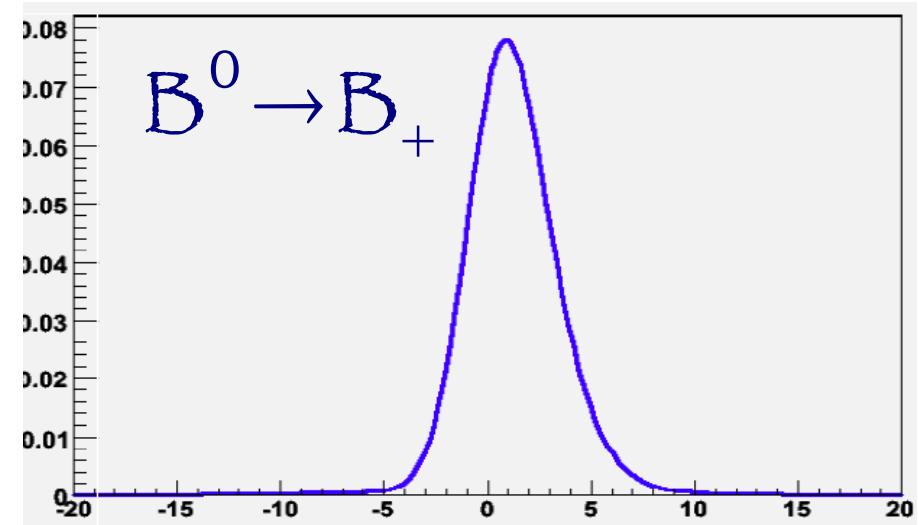

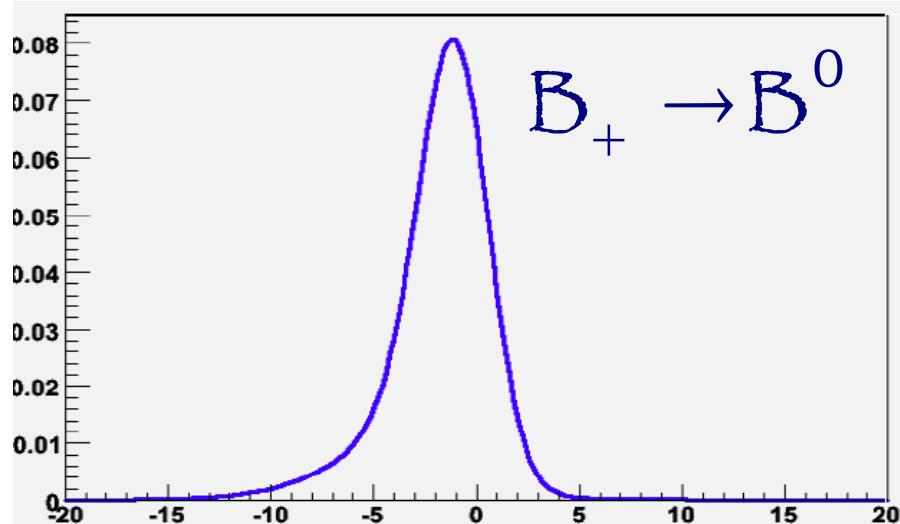

► Heavyside step function

# TV analysis steps : real data

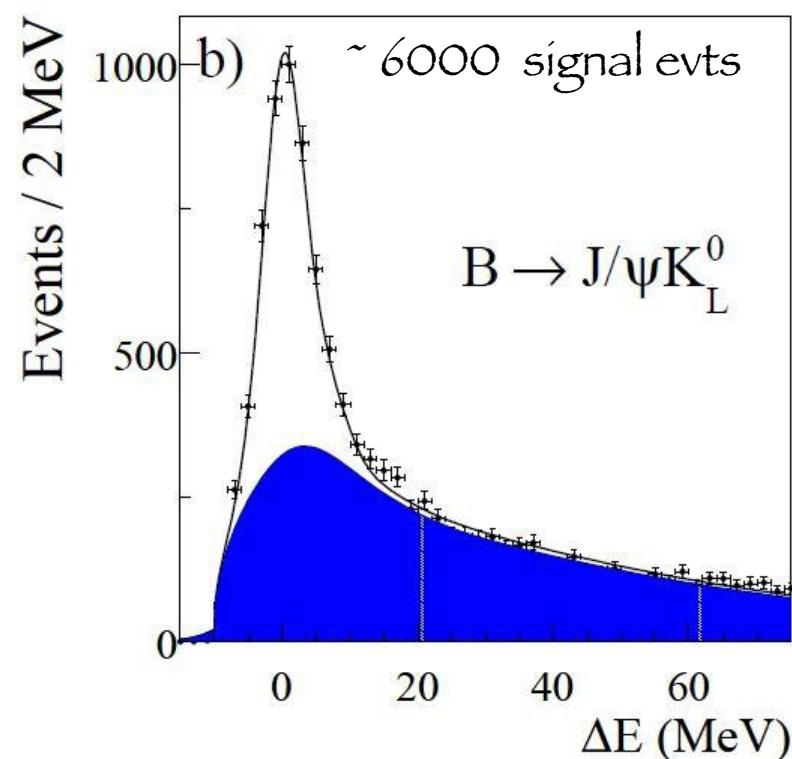

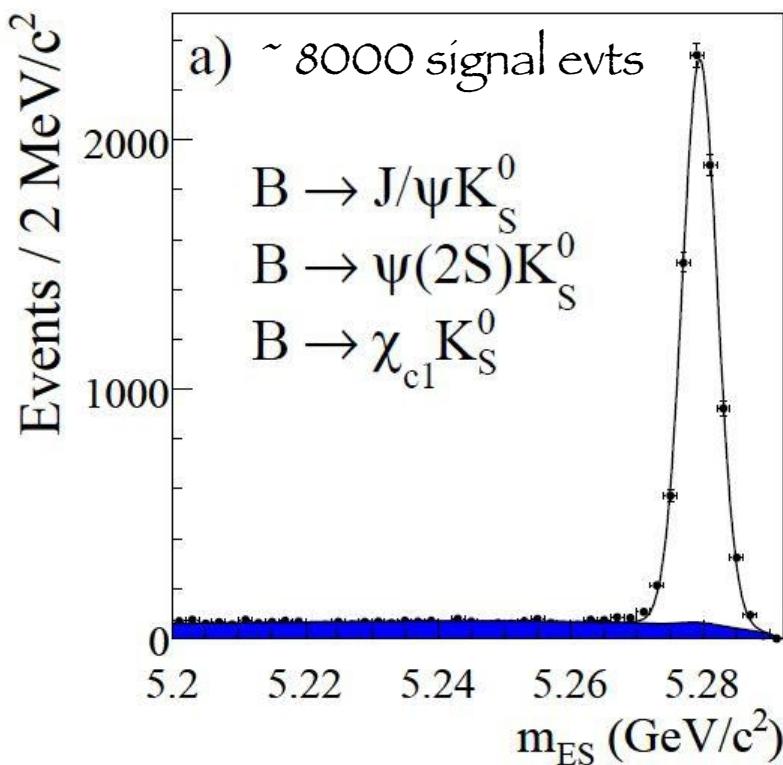

- Need to account for finite  $\Delta\tau$  resolution (parameters fitted in the data)

$$\mathcal{F}_{\alpha,\beta}^{\pm}(\Delta\tau) \propto g_{\alpha,\beta}^{\pm}(\Delta\tau') \times \mathcal{R}(\Delta\tau, \Delta\tau')$$

# TV analysis steps : real data

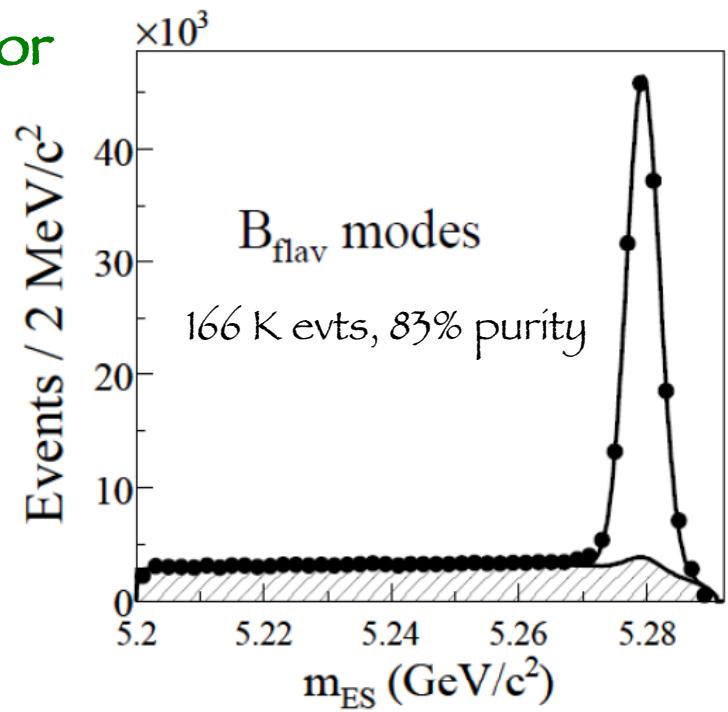

- Need to account for finite  $\Delta\tau$  resolution
- Need to account for background (mostly for  $J/\psi K_L$ )

- Need to account for finite  $\Delta\tau$  resolution
- Need to account for background (mostly for  $J/\psi K_L$ )
- Need to account for dilution from wrong flavor tags
  - Tag-category dependent
  - Use samples of fully reconstructed flavor eigenstates ( $D^{(*)}\pi, D^{(*)}K, J/\psi K^{(*)+} \dots$ )

BaBar PRL 109, 211801 (2012)

PART II  
MIXING – INDUCED CPV

- $B^0$  mass eigenstates differ from flavor eigenstate:

$$|B_{L/H}\rangle = \frac{1}{\sqrt{P^2+q^2}} [P|B^0\rangle \pm q|\bar{B}^0\rangle]$$

- $q = p = 2^{-1/2} \Leftrightarrow B_{L/H}$  are CP eigenstates, CP is conserved
- CP asymmetry :

$$\mathcal{A}_\ell = \frac{\Gamma(B^0(0) \rightarrow \bar{B}^0(t)) - \Gamma(\bar{B}^0(0) \rightarrow B^0(t))}{\Gamma(B^0(0) \rightarrow \bar{B}^0(t)) + \Gamma(\bar{B}^0(0) \rightarrow B^0(t))} = \frac{1 - |q/p|^4}{1 + |q/p|^4}$$

- Standard Model : very tiny effect

$$\mathcal{A}_\ell(B^0) = (-4.1 \pm 0.6) \cdot 10^{-4}$$

(Lenz, Nierste, arXiv:1102.4274 (2011)):

$$\mathcal{A}_\ell(B_s) = (1.9 \pm 0.3) \cdot 10^{-5}$$

- Positive observation : DISCOVERY OF NEW PHYSICS

- Colliders :  $B$  produced in opposite flavor pairs
- Mixing : find two equal-flavor mesons at decay time
- CP asymmetry is usually measured through  $B$  semileptonic decays :

$$\mathcal{A}_\ell = \frac{N(B^0\bar{B}^0) - N(\bar{B}^0\bar{B}^0)}{N(B^0\bar{B}^0) + N(\bar{B}^0\bar{B}^0)} = \frac{N(\ell^+\ell^+) - N(\ell^-\ell^-)}{N(\ell^+\ell^+) + N(\ell^-\ell^-)}$$

Negligible CP asymmetry in  
direct semileptonic decay  
(model independent)

- Consider also single – tag asymmetry:

$$\frac{N(B^0) - N(\bar{B}^0)}{N(B^0) + N(\bar{B}^0)} = \frac{N(\ell^+) - N(\ell^-)}{N(\ell^+) + N(\ell^-)} = \chi_d \mathcal{A}_\ell$$

- A new approach, pionereed by BABAR is here presented:

- “Reco” 1<sup>st</sup>  $B$  : partial reconstruction of  $B^0 \rightarrow \ell^+ \nu_\ell D^{*-}$
- “Tag” 2<sup>nd</sup>  $B$  : use charged Kaons

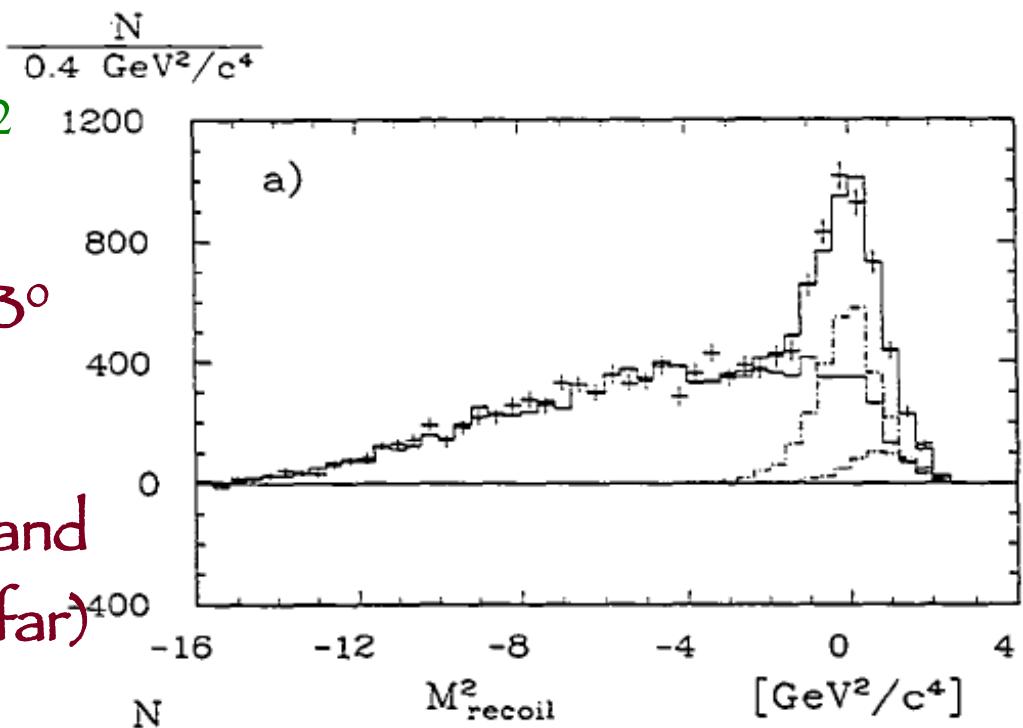

$$\mathcal{A}_{\ell\ell} = \frac{N(B^0\bar{B}^0) - N(\bar{B}^0\bar{B}^0)}{N(B^0\bar{B}^0) + N(\bar{B}^0\bar{B}^0)} = \frac{N(\ell^+K^+) - N(\ell^-K^-)}{N(\ell^+K^+) + N(\ell^-K^-)}$$

# $B \rightarrow D^* \ell \nu$ Partial Reconstruction

- Use only  $\ell$  and low momentum  $\pi_s$  from the decay  $D^{*-} \rightarrow \pi_s^- \bar{D}^0$
- Assume  $B^0$  at rest in  $Y(4S)$  frame  $\vec{P}_B \sim 0$
- Get  $D^*$  from  $\pi_s$ :  $\vec{P}_{D^*} = \vec{f}(\vec{P}_{\pi_s})$
- Compute missing mass from four momenta difference:

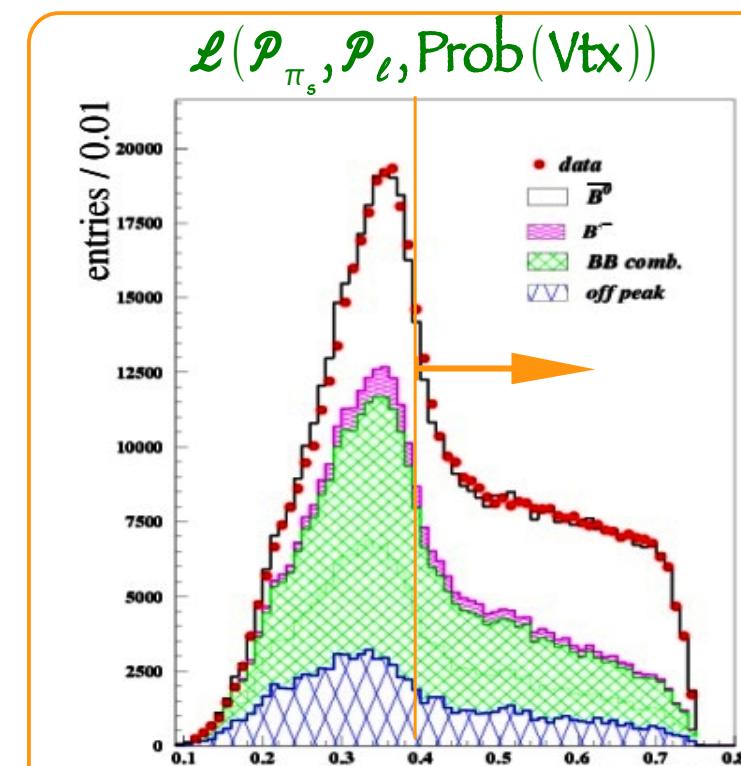

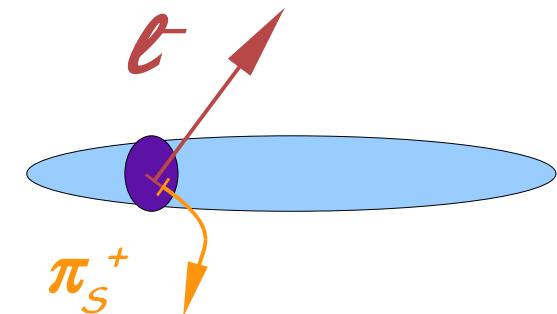

$$M_\nu^2 = (\mathcal{P}_B - \mathcal{P}_{D^*} - \mathcal{P}_\ell)^2$$

- ARGUS (1986) : first evidence of  $B^0$  mixing at the  $Y(4S)$  ...
- ... then CLEO, DELPHI, OPAL, and BABAR (4 published papers so far)

BABAR :

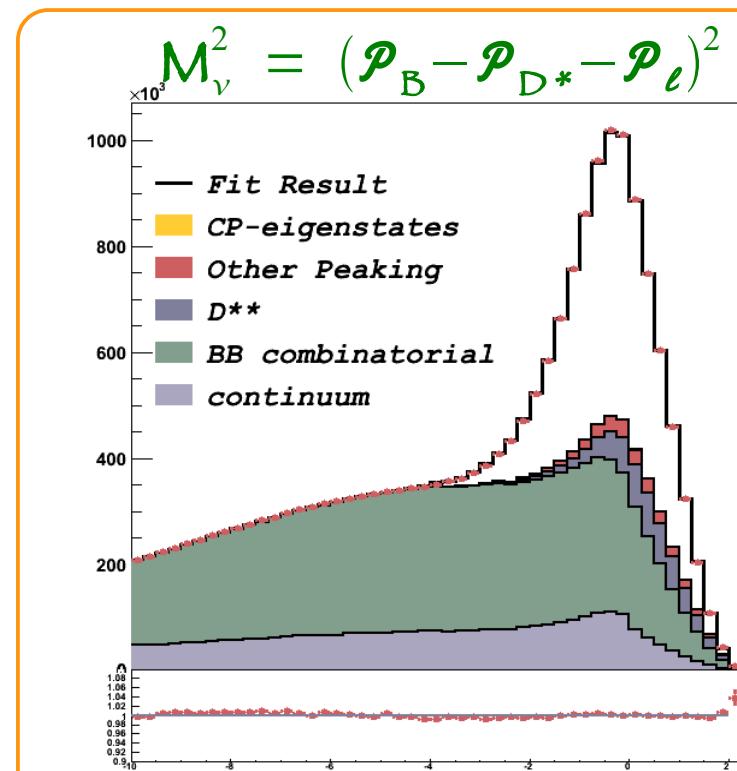

- B decay point intersecting beamspot,  $\ell, \pi_s$  tracks
- Selection : likelihood ratio combining  $P_\ell P_{\pi_s} \text{Prob}(\text{Vtx})$
- Cut  $\mathcal{L} > 0.4$

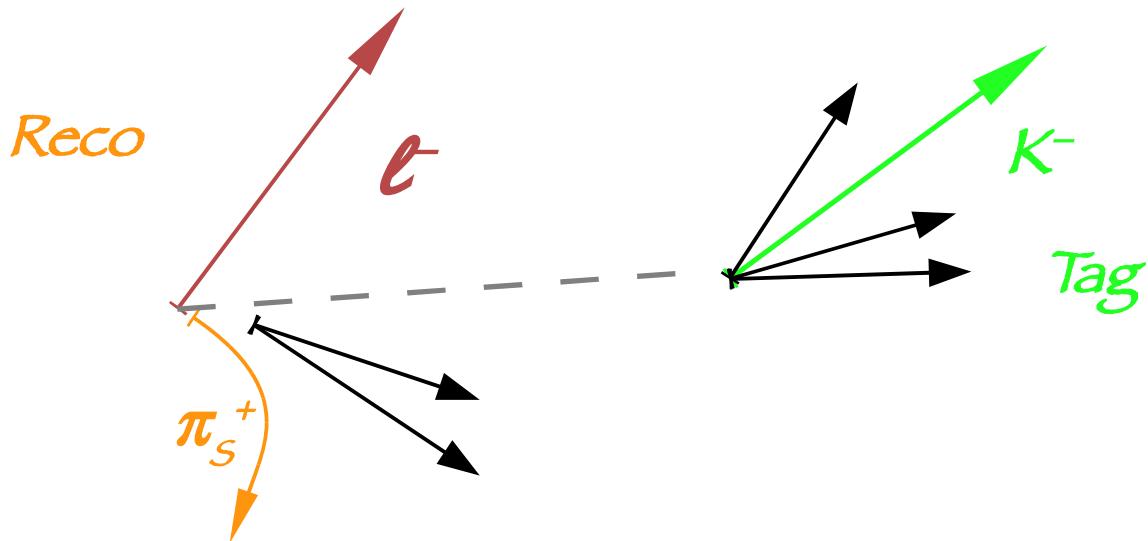

## Sample composition:

- continuum from rescaled off-peak events
- fit for  $B\bar{B}$  combinatorial, peaking  $B^+$ , and peaking  $B^0$  fractions assuming shapes from simulation
- combinatorial x-check in  $\ell^+\pi_s^+$  sample

$(5370 \pm 6) \cdot 10^3$  Peaking Events

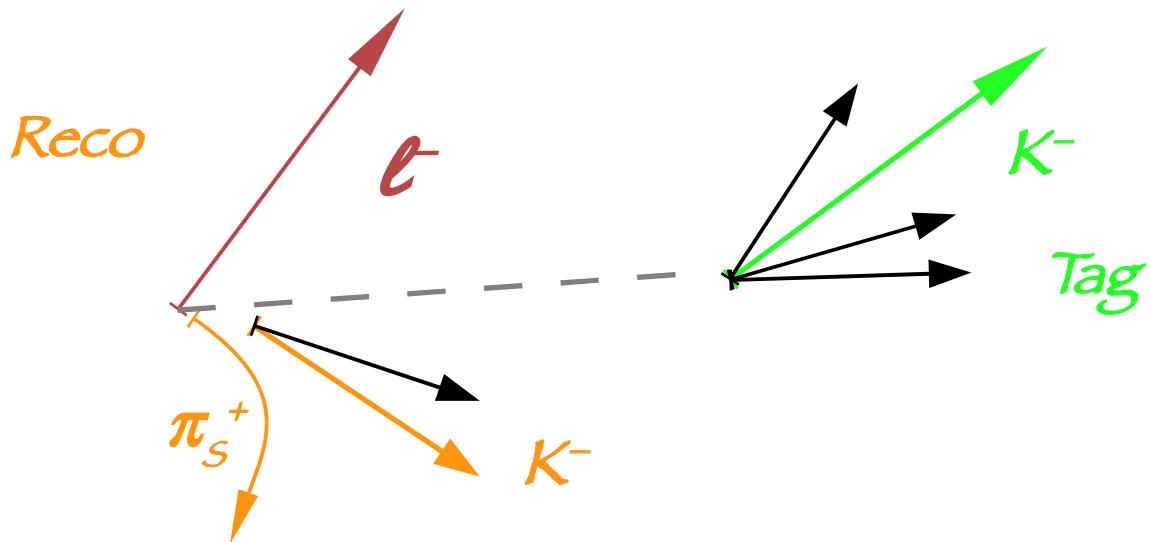

# The Kaon Tag

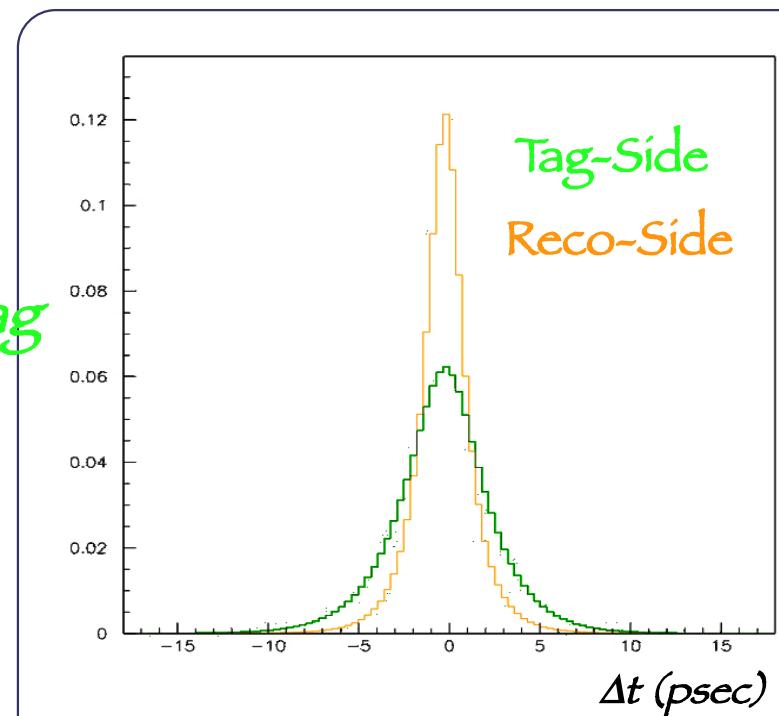

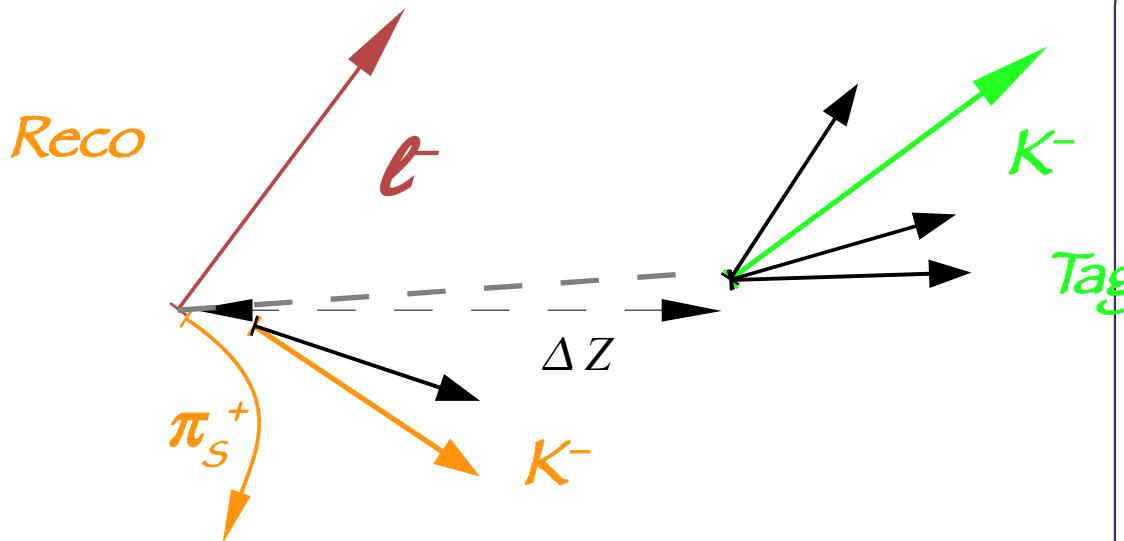

- $K^-$  identified using  $dE/dx$  & Cherenkov with high purity
- Tag-B decay point from intersection of Kaon track and beamspot
- Define  $\Delta Z = Z_{\text{RECO}} - Z_{\text{TAG}}$

# The Kaon Tag

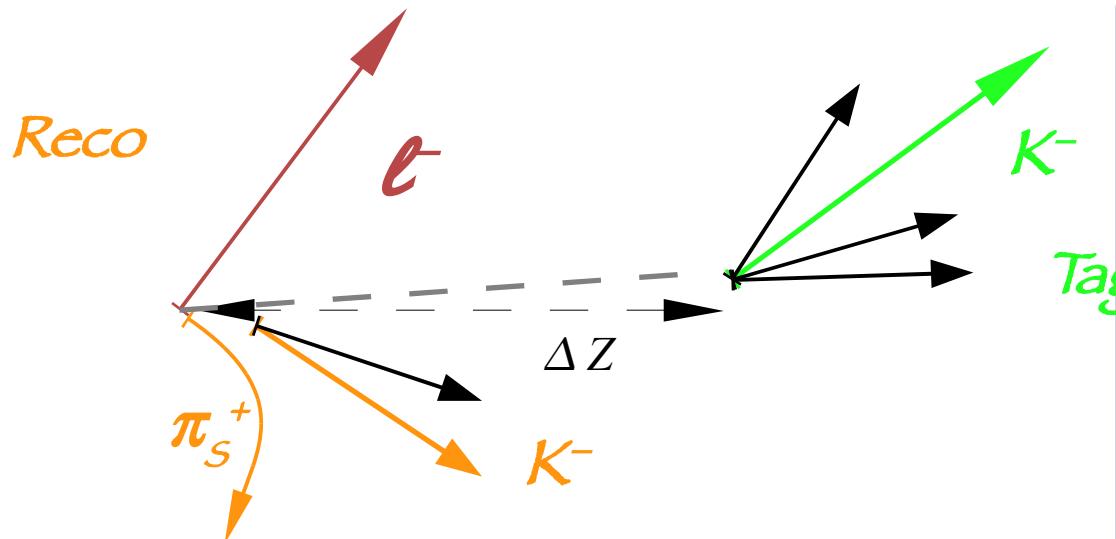

- Equal charge Kaons also from the reco side, mimick a mixed event .

# The Kaon Tag

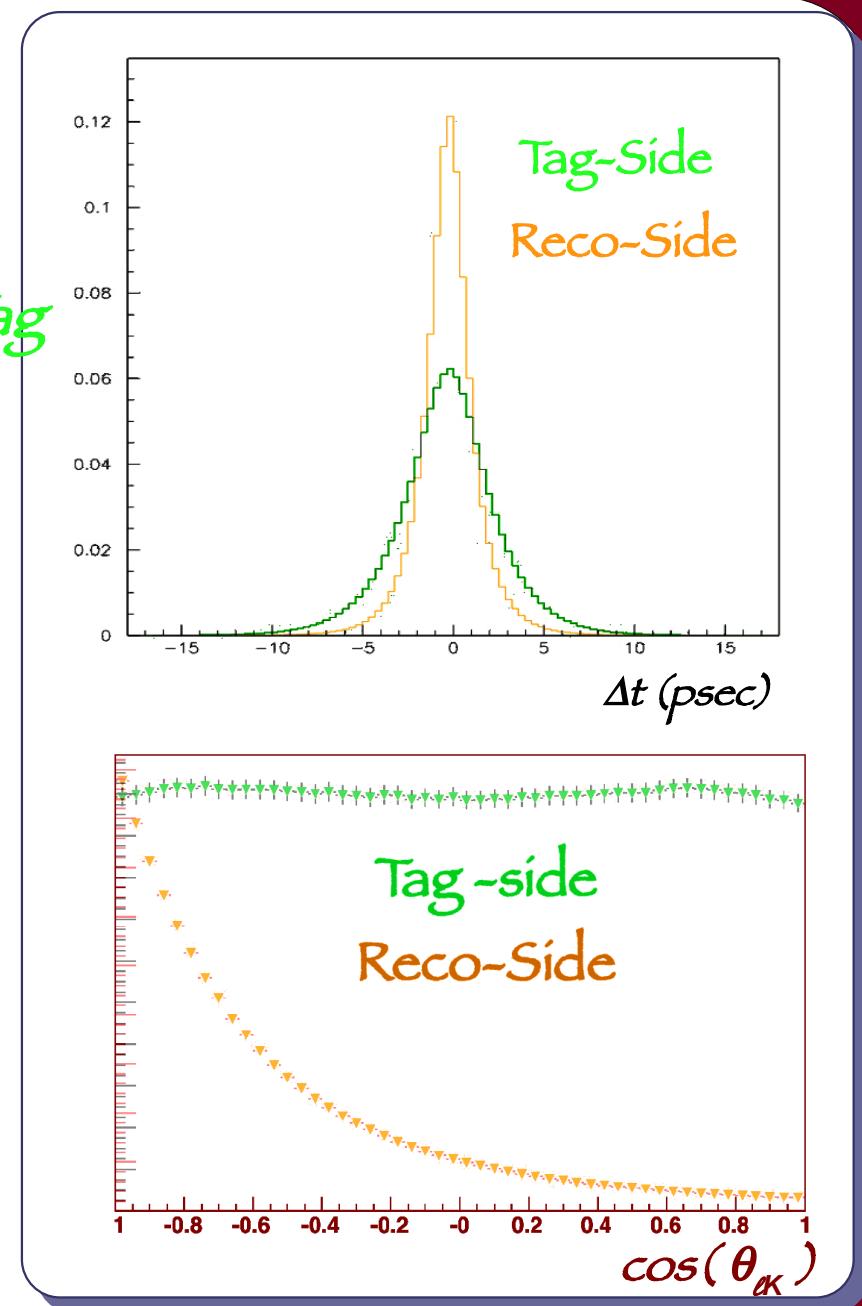

- Equal charge Kaons also from the reco side, mimick a mixed event .
- Separated on statistical basis by:
  - $\Delta t = (Z_e - Z_K) / (c\beta\gamma)$  (in the Lab)

# The Kaon Tag

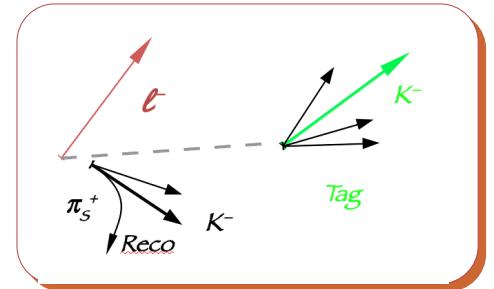

- Equal charge Kaons also from the reco side, mimick a mixed event .
- Separated on statistical basis by:
  - $\Delta t = (Z_\ell - Z_K) / (c\beta\gamma)$  (in the Lab)
  - $\cos(\theta_{\ell K})$  (in  $Y(4S)$  rest frame )

## Asymmetry

- Observed asymmetries for mixed reflect RECO-side charge asymmetry, K-id charge asymmetry and Physical asymmetry:

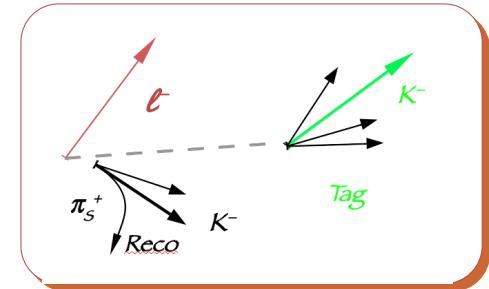

$$\mathcal{A}_{\text{obs},K\text{-Tag}} \simeq \mathcal{A}_{\text{Rec}} + \mathcal{A}_K + \mathcal{A}_{\ell\ell}$$

# Asymmetry

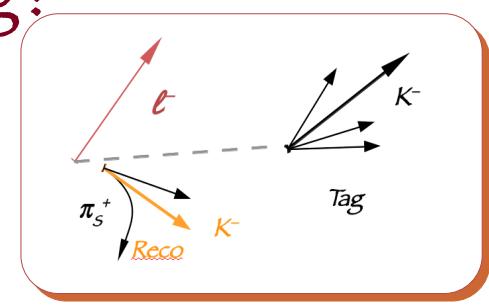

- Observed asymmetries for mixed reflect RECO-side charge asymmetry, K-id charge asymmetry and Physical asymmetry:

$$\mathcal{A}_{\text{obs},K\text{-Tag}} \simeq \mathcal{A}_{\text{Rec}} + \mathcal{A}_K + \mathcal{A}_{\ell\ell}$$

- Kaons from reco side have tiny contribution from mixing:

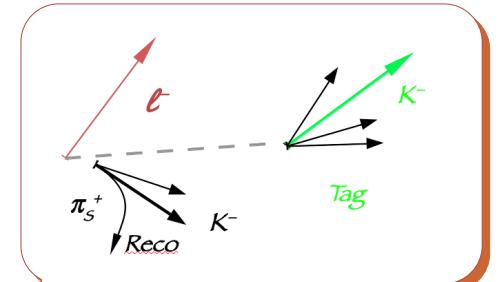

$$\mathcal{A}_{\text{obs},K\text{-Rec}} \simeq \mathcal{A}_{\text{Rec}} + \mathcal{A}_K + \chi_d \mathcal{A}_{\ell\ell}$$

# Asymmetry

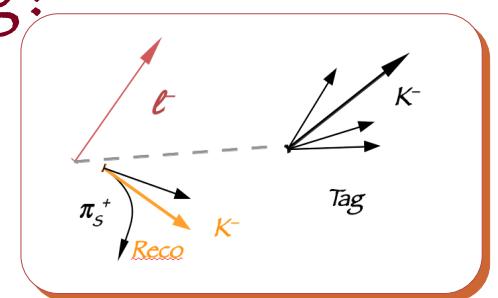

- Observed asymmetries for mixed reflect RECO-side charge asymmetry, K-id charge asymmetry and Physical asymmetry:

$$\mathcal{A}_{\text{obs},K\text{-Tag}} \simeq \mathcal{A}_{\text{Rec}} + \mathcal{A}_K + \mathcal{A}_{ll}$$

- Kaons from reco side have tiny contribution from mixing:

$$\mathcal{A}_{\text{obs},K\text{-Rec}} \simeq \mathcal{A}_{\text{Rec}} + \mathcal{A}_K + \chi_d \mathcal{A}_{ll}$$

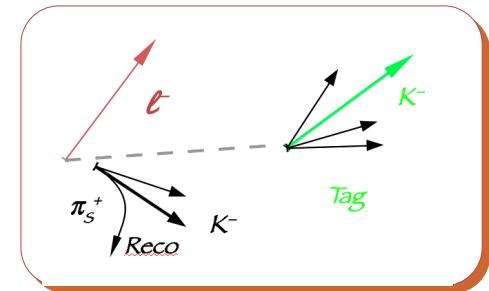

- Measure also single lepton asymmetry (before tagging) :

$$\mathcal{A}_{\text{obs,Rec}} = \frac{\ell^+ \pi_s^- - \ell^- \pi_s^+}{\ell^+ \pi_s^- + \ell^- \pi_s^+} \simeq \mathcal{A}_{\text{Rec}} + \chi_d \mathcal{A}_{ll}$$

# Asymmetry

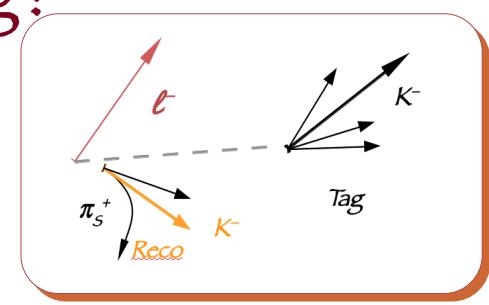

- Observed asymmetries for mixed reflect RECO-side charge asymmetry, K-id charge asymmetry and Physical asymmetry:

$$\mathcal{A}_{\text{obs},K\text{-Tag}} \simeq \mathcal{A}_{\text{Rec}} + \mathcal{A}_K + \mathcal{A}_{\ell\ell}$$

- Kaons from reco side have tiny contribution from mixing:

$$\mathcal{A}_{\text{obs},K\text{-Rec}} \simeq \mathcal{A}_{\text{Rec}} + \mathcal{A}_K + \chi_d \mathcal{A}_{\ell\ell}$$

- Measure also single lepton asymmetry (before tagging) :

$$\mathcal{A}_{\text{obs,Rec}} \simeq \mathcal{A}_{\text{Rec}} + \chi_d \mathcal{A}_{\ell\ell}$$

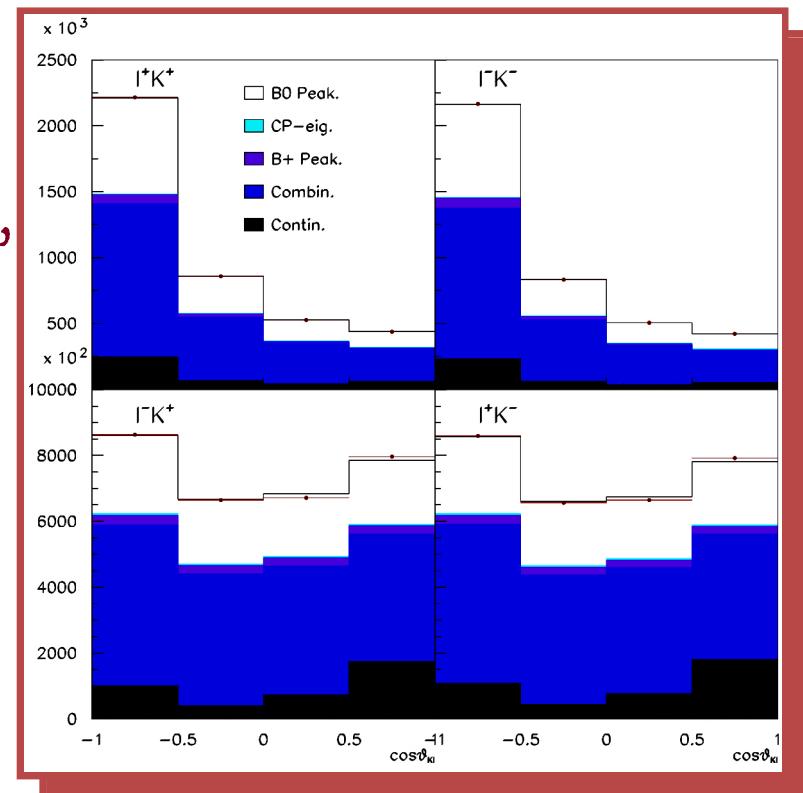

- Constrained system:

determine  $\mathcal{A}_{\ell\ell}$  and main sources of systematic uncertainty from the data

# MEASUREMENT

- 5D binned fit to  $(\Delta t, \sigma(\Delta t), \cos\theta_{eK}, M_v^2, p_K)$  space
- Use also opposite sign  $\ell^+K^- / \ell^-K^+$  to improve precision on resolution parameters, mis-tagging etc.
- More than 100 free parameters:
  - $A_{ee}$ ,  $A_{rec}$ ,  $A_K$ , K-Rec fraction, fraction of wrong tags (charge dependent), fraction of DCSC Kaons,  $\Delta Z$  resolution parameters, ...

BABAR Preliminary

$\cos\theta_{eK}$

# Peaking $B^0$ PDF

- Four terms, one per each  $\ell\kappa$  charge combination:

$\vec{j} = (\cos \theta_{\ell\kappa}, M_\nu^2, p_\kappa, \Delta t, \sigma(\Delta t))$  bin

$\mathcal{G}_{B\bar{B}} = \text{PDF}$  for tag side  $\kappa$

$\mathcal{G}_{\kappa r} = \text{PDF}$  for reco side  $\kappa$

$\omega$  = wrong charge tag frac.

# Peaking $B^0$ Pdf - Tag Side

- $\cos\theta_{\ell K}$ ,  $M_v^2$ ,  $p_K$  : from simulation
- $\Delta t$ : convolve resolution with Physics-motivated functions :

$$\begin{aligned}\mathcal{F}_{B^0 \bar{B}^0}(\Delta t') &= \mathcal{E}(\Delta t') \left[ \left(1 + \left|\frac{q}{p}\right|^2 r'^2\right) \cosh(\Delta\Gamma\Delta t'/2) + \left(1 - \left|\frac{q}{p}\right|^2 r'^2\right) \cos(\Delta m_d \Delta t') - \left|\frac{q}{p}\right| (b+c) \sin(\Delta m_d \Delta t') \right] \\ \mathcal{F}_{B^0 \bar{B}^0}(\Delta t') &= \mathcal{E}(\Delta t') \left[ \left(1 + \left|\frac{p}{q}\right|^2 r'^2\right) \cosh(\Delta\Gamma\Delta t'/2) + \left(1 - \left|\frac{p}{q}\right|^2 r'^2\right) \cos(\Delta m_d \Delta t') + \left|\frac{p}{q}\right| (b-c) \sin(\Delta m_d \Delta t') \right] \\ \mathcal{F}_{\bar{B}^0 \bar{B}^0}(\Delta t') &= \mathcal{E}(\Delta t') \left[ \left(1 + \left|\frac{p}{q}\right|^2 r'^2\right) \cosh(\Delta\Gamma\Delta t'/2) - \left(1 - \left|\frac{p}{q}\right|^2 r'^2\right) \cos(\Delta m_d \Delta t') - \left|\frac{p}{q}\right| (b-c) \sin(\Delta m_d \Delta t') \right] \left|\frac{q}{p}\right|^2 \\ \mathcal{F}_{B^0 B^0}(\Delta t') &= \mathcal{E}(\Delta t') \left[ \left(1 + \left|\frac{q}{p}\right|^2 r'^2\right) \cosh(\Delta\Gamma\Delta t'/2) - \left(1 - \left|\frac{q}{p}\right|^2 r'^2\right) \cos(\Delta m_d \Delta t') + \left|\frac{q}{p}\right| (b+c) \sin(\Delta m_d \Delta t') \right] \left|\frac{p}{q}\right|^2 \\ \mathcal{E}(\Delta t') &= \frac{\Gamma_0}{2(1+r'^2)} e^{-\Gamma_0 |\Delta t'|},\end{aligned}$$

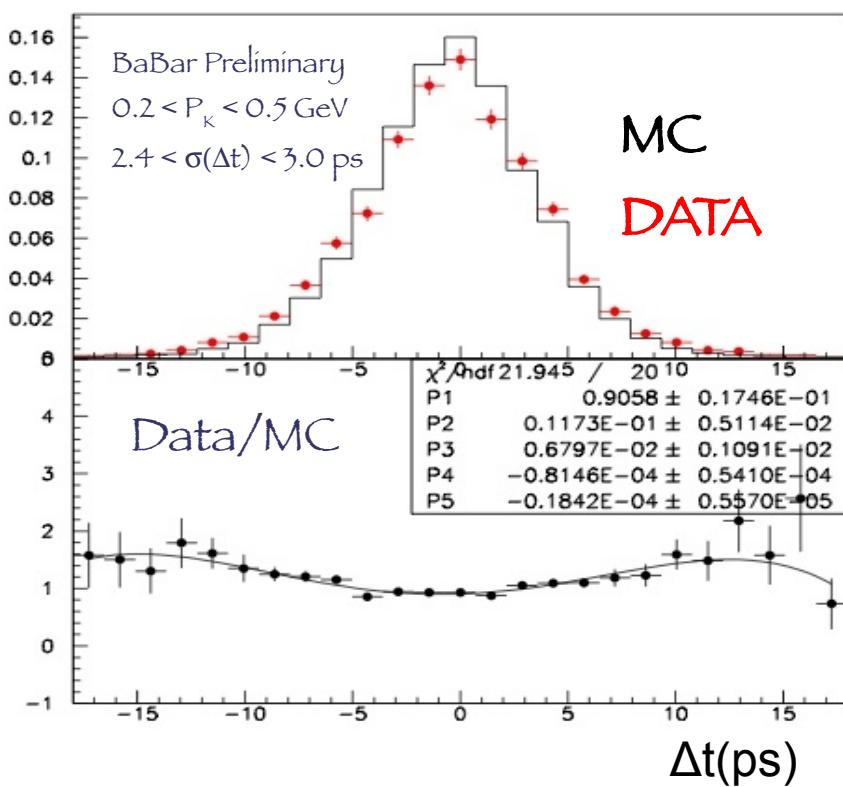

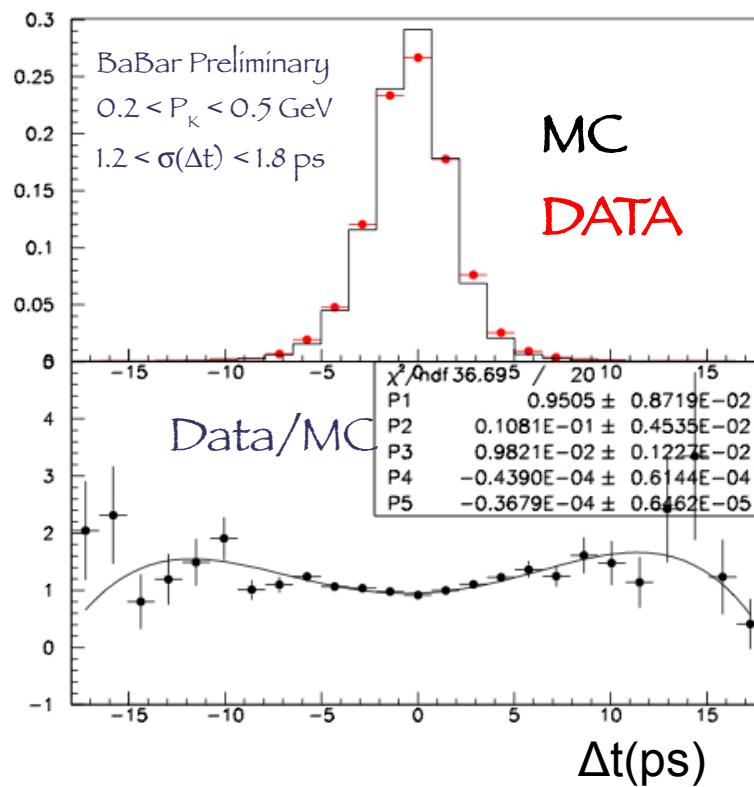

CP violation in the tag side :

$$r'$$

$$b = 2r' \sin(2\beta + \gamma) \cos\delta',$$

$$c = -2r' \sin(2\beta + \gamma) \sin\delta'$$

- $\cos\theta_{\ell K}$ ,  $M_v^2$ ,  $p_K$  : from simulation
- $\Delta t$  : use enriched Reco-side sample

- Combinatorial  $B^0$  : similar to peaking  $B^0$ , many common parameters, including  $|q/p|$  and detector asymmetries
- Peaking and combinatorial  $B^+$  : same approach, use pure lifetime  $\Delta t$  PDF, helps constraining detector asymmetries, resolution parameters, etc.
- Continuum : parameterized PDF from off-peak events

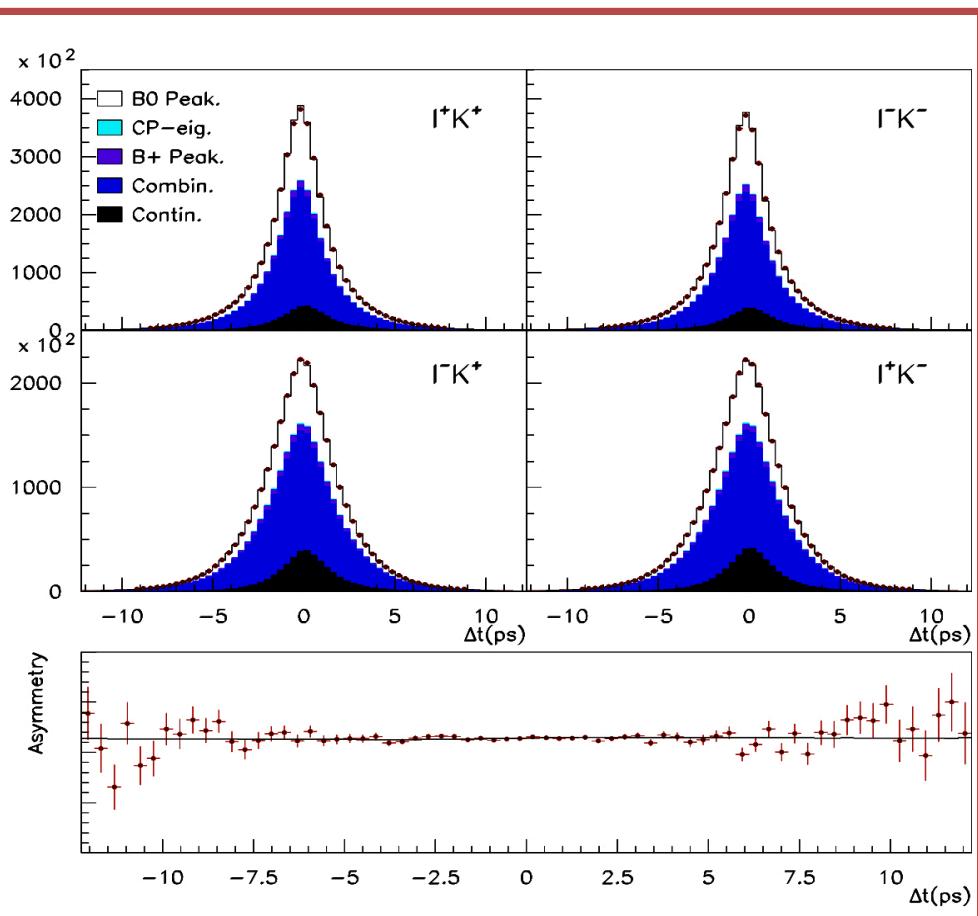

# Results

$$\mathcal{A}_{ll} = (0.06 \pm 0.16^{+0.36}_{-0.32})\%$$

- No positive observation

# Results

BABAR Preliminary

$$\mathcal{A}_{ll} = (0.06 \pm 0.16^{+0.36}_{-0.32})\%$$

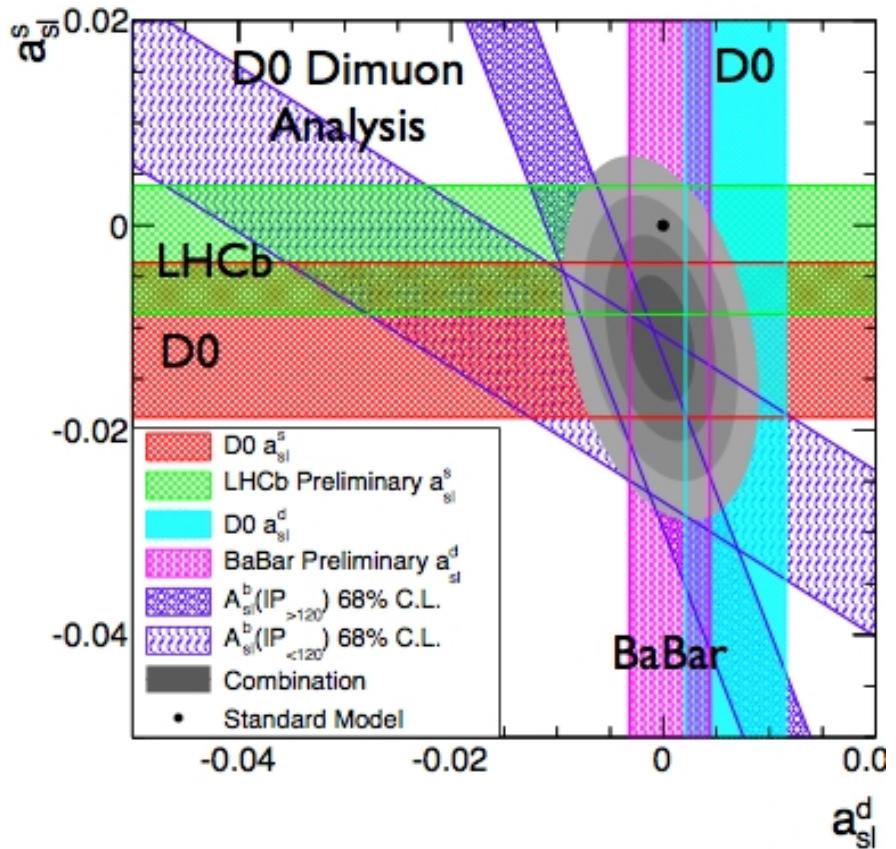

- Consistent and more precise than previous B-Factories average:

$$\mathcal{A}_{ll} = (-0.05 \pm 0.56)\%$$

- Competitive and complementary to similar measurements at hadron colliders

- Contributing to world class precision in the determination of B-mixing CP asymmetries

- WA (grey) consistent with SM @ less than 2  $\sigma$

# Conclusions

Five years after end running, BABAR has still glamour results on CP/T-Violation:

- First uncontroversial evidence of T-Violation in the  $B$ -meson system
- Most stringent limit of mixing-induced CP-Violation in the evolution of  $B^0$  mesons

CLEAR: PLB 444, 43 (1998)  
Compares  $K^0 \rightarrow \bar{K}^0$  with  $\bar{K}^0 \rightarrow K^0$

Mixing rate.

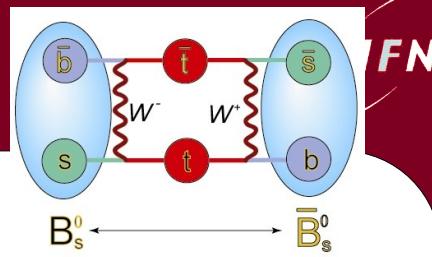

- Related by T and CP.
- Not time-dependent.
- Various criticisms.

BABAR:  
PRD(RC)81, 111103 (2010)  
PRD(RC) 84, 031103 (2011)  
Triple products

- DO claims large unexpected asymmetry in equal charge dilepton B decays at ICHEP 2010
  - Lifetime analysis : effect connected to  $B_s$  mixing
  - DO and LHCb then measure asymmetry in the rates of  $B_s \rightarrow D^{(*)}_s \mu \nu$  decays
  - These measurements are consistent both with the SM and with DO dilepton results

# $B^0$ Mixing parameters

- Two-levels system evolution:

$$i \frac{d}{dt} \left( \frac{B_q}{\bar{B}_q} \right) = \left[ \begin{pmatrix} M_{11}^q & M_{21}^{q*} \\ M_{21}^q & M_{11}^q \end{pmatrix} - \frac{i}{2} \begin{pmatrix} \Gamma_{11}^q & \Gamma_{21}^{q*} \\ \Gamma_{21}^q & \Gamma_{11}^q \end{pmatrix} \right] \left( \frac{B_q}{\bar{B}_q} \right)$$

- Mass eigenstates are related to flavor eigenstates by the relation:

$$|B_{L,H}\rangle = \frac{1}{\sqrt{p^2 + q^2}} (|B^0\rangle \pm \frac{q}{p} |\bar{B}^0\rangle)$$

- Where

$$\mathcal{A}_{\ell\ell} = \frac{1 - |q/p|^4}{1 + |q/p|^4} = \frac{\Gamma_{12}}{M_{12}} \sin \phi \quad (\phi = -\text{Arg} \frac{M_{12}}{\Gamma_{12}})$$

- We have:

$$|q/p| = 1 - (0.3^{+1.8}_{-2.0}) \cdot 10^{-3} \quad \text{This Measurement}$$

$$|q/p| = 1 + (0.2 \pm 2.8) \cdot 10^{-3} \quad \text{Previous W.A.}$$
