

Latest results on Spectroscopy from LHCb

Thursday, 28 August 2014 18:10 (25 minutes)

Decays of b-hadrons to light quarks allow spectroscopy measurements with a well defined initial state. The decay $B(s) \rightarrow J/\psi \pi \pi$ gives insight on the quark content of the $f_0(500)$ and $f_0(980)$ mesons, while the decays $B \rightarrow \text{pph}$ and $\Lambda_b \rightarrow J/\psi \text{ph}$ allow for baryon spectroscopy. This talk also includes results on exotic charmonium resonances.
