

Hierarchy-Constraints Patch Validation

Additional Information on the Parameter Comparison

Matthias Schröder

Validation Strategy

2011 legacy alignment

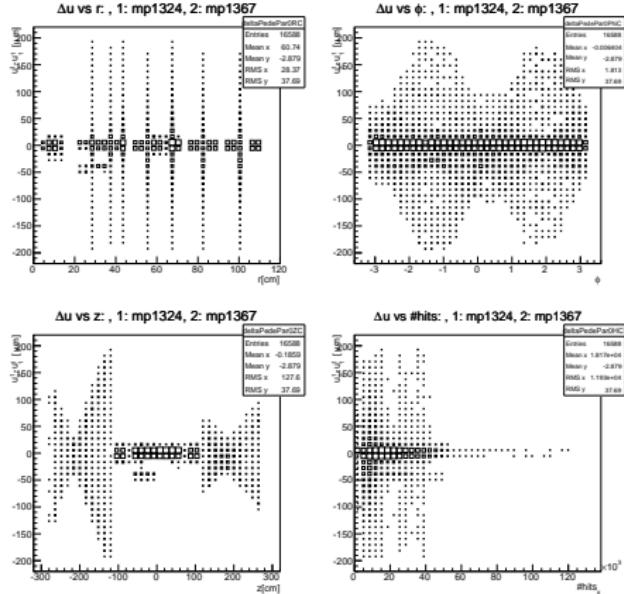

- Iterations of 2011 legacy-alignment reproduced using patched CMSSW_4_4_5
- Comparison of resulting parameters with CompareMillePede tool

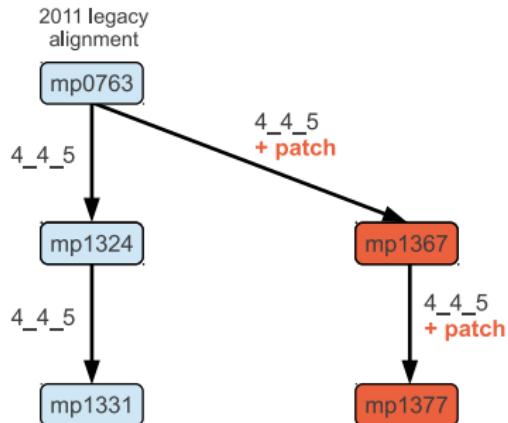

See presentation by Andrii in last CMS Tracker-Alignment Meeting

Parameter-Comparison Results

0th iteration: mp1324 vs mp1367

- RMS(Δu) $\approx 40 \mu\text{m}$

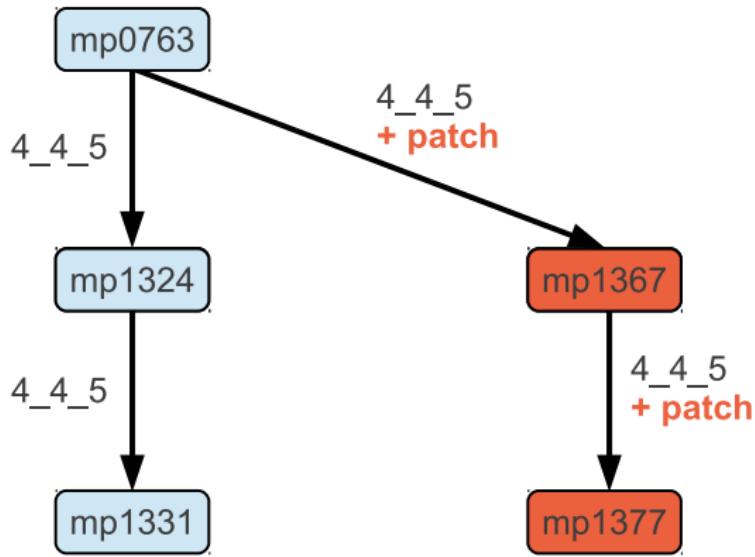

- Differences of parameter values after 0th iteration (mp1324 vs mp1367) with RMS of several $10 \mu\text{m}$
- Same size after 1st iteration (mp1331 vs mp1377)
- $< 10 \mu\text{m}$ after 2nd iteration

Additional Information on the CompareMillePede Tool

- CompareMillePede tool compares absolute parameter values
- Implicit dependence on starting geometry!

2011 legacy
alignment

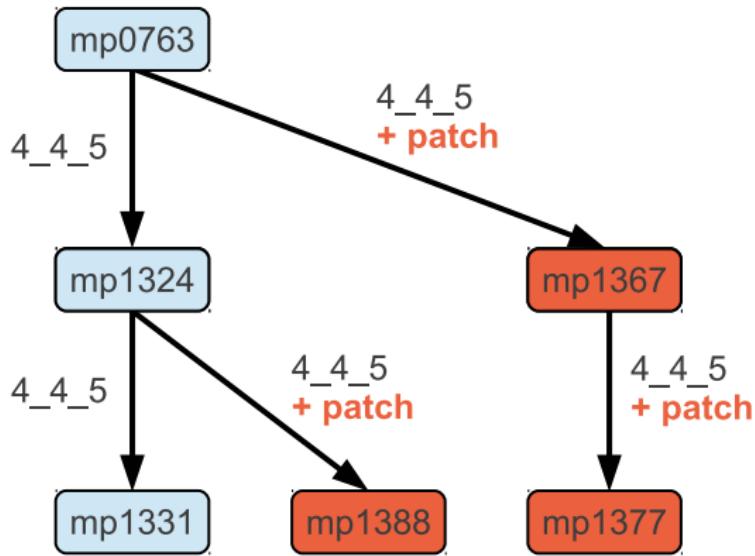

- In case of 1st iteration (mp1331 vs mp1377), some part of difference possibly due to different starting geometries (also the case for 2nd iteration)

Additional Information on the CompareMillePede Tool

- CompareMillePede tool compares absolute parameter values
- Implicit dependence on starting geometry!

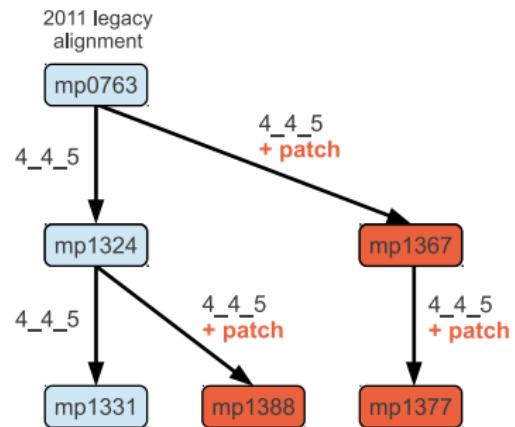

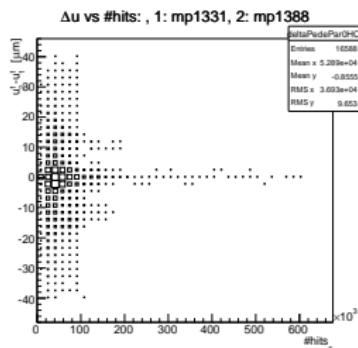

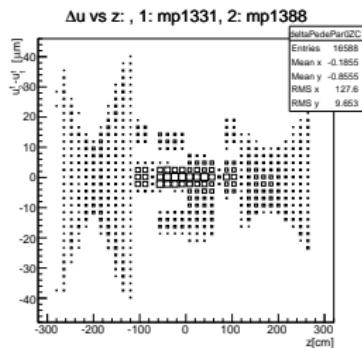

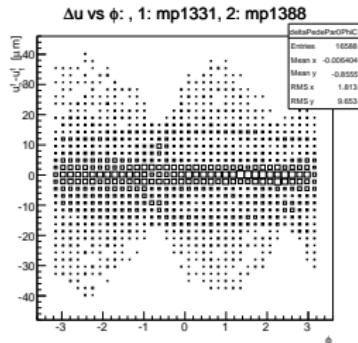

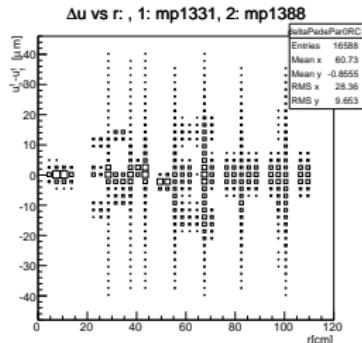

2011 legacy
alignment

- In case of 1st iteration (mp1331 vs mp1377), some part of difference possibly due to different starting geometries (also the case for 2nd iteration)
- Run patch directly on mp1324

1st Iteration with same Starting Geometry

mp1331 vs mp1388

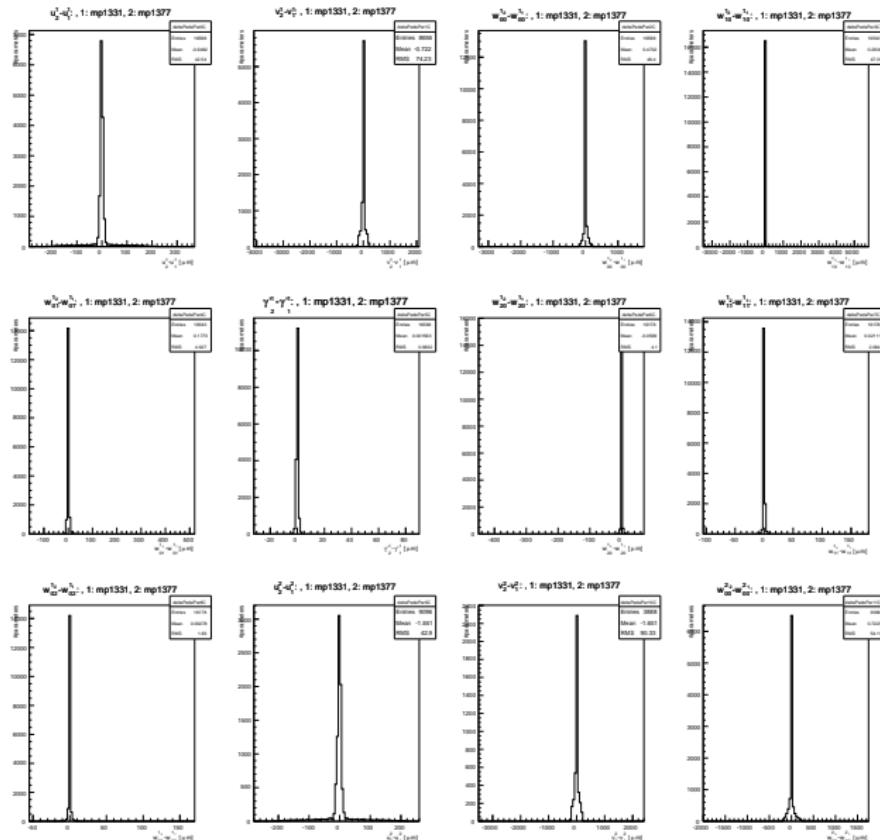

- Differences of parameter values due to patch
- RMS of $\approx 10 \mu\text{m}$

Summary & Conclusions

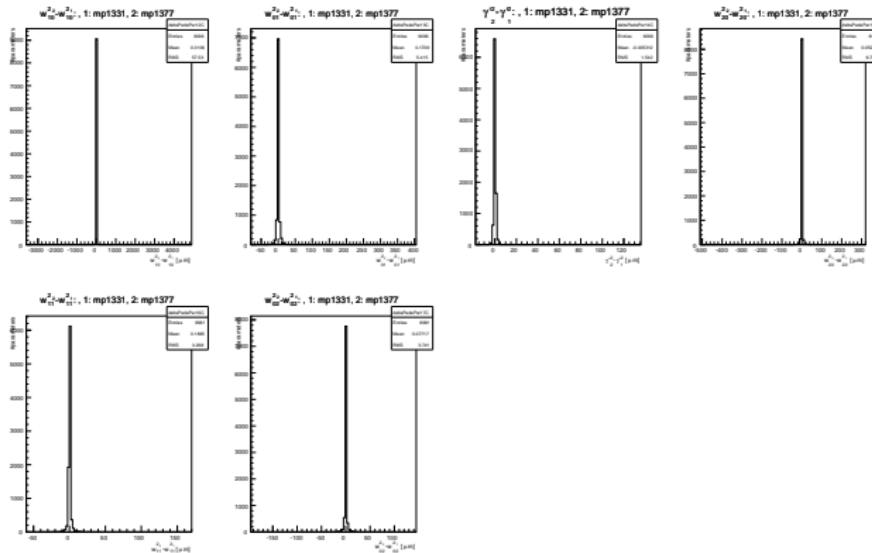

- 2011 legacy-alignment has been redone using the patched CMSSW_4_4_5 version
- Reported differences of parameter values (RMS) obtained with and without patch
 - ▶ 0th iteration: several 10 μm
 - ▶ 1st iteration: several 10 μm
 - ▶ 2nd iteration: < 10 μm
- In case of 1st and 2nd iteration, observed differences partly due to the fact that different starting geometries have been used
- Faster reduction of differences when starting from the same geometry each time
 - ▶ Differences of $\approx 10 \mu\text{m}$ after 1st iteration
- Reinterpretation of reported parameter differences
- Same conclusion: patch does not spoil the alignment result
