# Reminder on double field theory

Once upon a time...

- ▶ Sigma model  $X : \Sigma \rightarrow M = T^d$

$$S = \int_{\Sigma} h^{\alpha\beta} \partial_{\alpha} X^i \partial_{\beta} X^j G_{ij} d\mu_{\Sigma} + \int_{\Sigma} X^* B ,$$

where  $h \in \Gamma(\otimes^2 T^* \Sigma)$ ,  $G \in \Gamma(\otimes^2 TM)$ ,  $B \in \Gamma(\wedge^2 T^* M)$ .

- ▶ Classical solutions to e.o.m. (take *closed* string  $\Sigma = \mathbb{R} \times S^1$ )

$$X_R^i = x_{0R}^i + \alpha_0^i (\tau - \sigma) + i \sum_{n \neq 0} \frac{1}{n} \alpha_n^i e^{-in(\tau - \sigma)} , \quad X_L^i = \dots ,$$

$$\alpha_0^i = \frac{1}{\sqrt{2}} G^{ij} \left( p_j - (G_{jk} + B_{jk}) w^k \right) ,$$

- ▶  $p_j$ : Canonical momentum zero modes
- ▶  $w^k$ : *Winding* zero modes,  $w^k := \frac{1}{2\pi} \int_0^{2\pi} \partial_{\sigma} X^k d\sigma$ .

i.e. “doubled configuration space”. Observables  $\phi(x, \tilde{x})$ .

- ▶ In addition: Observables in string theory obey the level matching constraint:

$$\partial_i \tilde{\partial}^i \phi + \tilde{\partial}^i \partial_i \phi = 0. \quad (2)$$

- ▶ Problem: If  $\phi, \psi$  obey (2),  $\phi\psi$  doesn't! Solution: Strong constraint:

$$\partial_i \phi \tilde{\partial}^i \psi + \tilde{\partial}^i \phi \partial_i \psi = 0, \quad (3)$$

for all elements  $\phi, \psi$  of the algebra of observables.

# Parity change and Lie algebroids

Mackenzie, Xu, Weinstein, Liu, Roytenberg, Voronov

- ▶  $V = \text{span}(e_1, \dots, e_n)$  finite dimensional vector space with dual  $V^* = \text{span}(e^1, \dots, e^n)$ .
- ▶  $n$  variables  $x^i$  for  $v = x^i e_i$ , corresponding to  $e^i$  by  $e^i(v) = x^i$ .
- ▶ Consider polynomials  $p = a_{i_1 \dots i_k} x^{i_1} \dots x^{i_k} \in \text{Pol}^\bullet(V)$ .
- ▶ Taking  $x^i$  to be Grassmannian,  $p$  corresponds to wedge products of  $e^i$ , i.e.

$$\text{Pol}^\bullet(\Pi V) \simeq \wedge^\bullet(V^*), \quad \Pi : \text{parity reversion}.$$

- ▶ Derivations on  $\text{Pol}^\bullet(\Pi V)$  correspond to derivations on  $\wedge^\bullet V^*$ , i.e. differentials if they square to zero.

## Definition

A vector bundle  $A \rightarrow M$  is called Lie algebroid, if there exists a homological vector field  $d_A$  (also expressed as a derivation of square 0) on the supermanifold  $\Pi A$ , i.e.  $[d_A, d_A] = 0$ .

# An example: $(M, \pi)$ Poisson manifold

Mackenzie, Xu, Weinstein, Liu, Roytenberg, Voronov

- ▶  $A = TM$ , basis of sections  $e_i$ ,  $[e_i, e_j]_A = f_{ij}^k e_k$   
label coordinates on  $\Pi A$  by  $(x^i, \xi^i)$  and the anchor  
 $a : TM \rightarrow TM$  by  $a_j^i$ , then the de Rham differential is

$$d_A = a_j^i(x) \xi^j \partial_i - \frac{1}{2} f_{ij}^k(x) \xi^i \xi^j \frac{\partial}{\partial \xi^k} . \quad (5)$$

- ▶  $A^* = T^*M$ , basis  $e^i$ ,  $[e^i, e^j]_{A^*} = Q_k^{ij} e^k$ ,  
label coordinates on  $\Pi A^*$  by  $(x^i, \theta_j)$  and the anchor  
 $a : T^*M \rightarrow TM$  by  $a^{ij}$ , then the Poisson-Lichnerowicz  
differential is

$$d_{A^*} = a^{ij}(x) \theta_i \partial_j - \frac{1}{2} Q_k^{ij}(x) \theta_i \theta_j \frac{\partial}{\partial \theta_k} . \quad (6)$$

The pair  $(A, A^*)$  is an example of a *Lie bialgebroid*.

outlook

# Taking the cotangent bundle

Roytenberg, arXiv:math/9910078

Why? Idea:  $d_A$  gives  $\partial_i$  on functions. Relation of  $d_{A^*}$  to  $\tilde{\partial}^i$ ? - If so, we need to get expressions like  $\partial_i f + \tilde{\partial}^i f$ , i.e. *define a meaningful sum of  $d_A$  and  $d_{A^*}$ !*

- ▶  $T^*\Pi_A$ : Coordinates  $(x^i, \xi^i, x_i^*, \xi_i^*)$ . Poisson structure:

$$\{x^j, x_i^*\} = \delta_i^j, \quad \{\xi^j, \xi_i^*\} = \{\xi_i^*, \xi^j\} = \delta_i^j.$$

De Rham differential is now given by taking the Poisson bracket with the function

$$h_{d_A} = a_j^i(x) x_j^* \xi^i - \frac{1}{2} f_{ij}^k \xi^i \xi^j \xi_k^*, \quad (7)$$

- ▶  $T^*\Pi_{A^*}$ : Coordinates  $(x^i, \theta_i, x_i^*, \theta_i^*)$ . Poisson structure:

$$\{x^j, x_i^*\} = \delta_i^j, \quad \{\theta_i, \theta_i^*\} = \{\theta_i^*, \theta_i\} = \delta_i^i.$$

Poisson-Lichnerowicz differential "lifted" to

$$h_{d_{A^*}} = a^{ij}(x) \theta_i x_j^* - \frac{1}{2} Q_k^{ij} \theta_i \theta_j \theta_k^*. \quad (8)$$

# Legendre transform and Drinfel'd double

Roytenberg, arXiv:math/9910078

Symplectic  
supermanifolds and  
the gauge algebra of  
double field theory

Andreas Deser<sup>1</sup> and  
Jim Stasheff<sup>2</sup>

Relation between the two bundles: *Legendre transform*:

$$L : T^*\Pi A \rightarrow T^*\Pi A^* , L(x^i, \xi^j, x_i^* , \xi_j^*) = (x^i, \xi_j^* , x_i^* , \xi^j) .$$

Gives the possibility to pull-back  $h_{d_{A^*}}$  and add it to  $d_A$ :

$$\mu := h_{d_A} + L^* h_{d_{A^*}} . \quad (9)$$

## Theorem

A pair of Lie algebroids  $(A, A^*)$  is a Lie bialgebroid iff  $\{\mu, \mu\} = 0$ .

Thus the following definition is justified:

## Definition

The Drinfel'd double of a Lie bialgebroid  $(A, A^*)$  is given by  $T^*\Pi A$  together with the homological vector field  $\{\mu, \cdot\}$ .

Reminder on double  
field theory

Question

Parity change and Lie

An example

Taking the cotangent  
bundle

Legendre transform  
and Drinfel'd double

Application to double  
field theory

Main results

Conclusions and  
outlook

# Application to double field theory

Deser, Stasheff, arXiv:1406.3601

Symplectic  
supermanifolds and  
the gauge algebra of  
double field theory

Andreas Deser<sup>1</sup> and  
Jim Stasheff<sup>2</sup>

Two sets of momenta:

$$h_{d_A} = \xi^i \left( a_i^j x_j^* - \frac{1}{2} f_{ij}^k \xi_j \xi_k^* \right) =: \xi^i p_i ,$$
$$L^* h_{d_{A^*}} = \xi_i^* \left( a^{ij} x_j^* + Q_k^{ij} \xi^k \xi_j^* \right) =: \xi_i^* \tilde{p}^i .$$

Thus, we get two derivative operators for  $f \in C^\infty(M)$ , seen as  $f \in C^\infty(T^*\Pi A)$ :

$$\partial_i f := \{p_i, f\} , \quad \tilde{\partial}^i f := \{\tilde{p}^i, f\} , \quad (10)$$

i.e. think of  $f$  as  $f(x, \tilde{x})$ . More general: Lift of a generalized vector field:

$$V^m \partial_m + V_m dx^m \rightarrow V^m(x, \tilde{x}) \xi_m^* + V_m(x, \tilde{x}) \xi^m \in C^\infty(T^*\Pi A) .$$

Now, what is the C-bracket and the strong constraint?

## Theorem

Let  $V^m e_m + V_m e^m$  and  $W^m e_m + W_m e^m$  be generalized vectors with corresponding lifts to  $T^*\Pi A$  given by  $V = V^m \xi_m^* + V_m \xi^m$  and  $W = W^m \xi_m^* + W_m \xi^m$ . In addition let the operation  $\circ$  be defined by:

$$V \circ W = \left\{ \left\{ \xi^i p_i + \xi_i^* \tilde{p}^i, V \right\}, W \right\},$$

Then the C-bracket of  $V$  and  $W$  is given by

$$[V, W]_C = \frac{1}{2} (V \circ W - W \circ V). \quad (11)$$

Thus, the C-bracket can be seen as a Courant bracket, written in a form appropriate to DFT.

## Theorem

Let  $\phi(x, \tilde{x}), \psi(x, \tilde{x})$  be two double scalar fields and  $D = \{\mu, \cdot\}$  the homological vector field on  $T^*\Pi A$ . Then we have

$$0 = \{D^2\phi, \psi\} = \partial_i\phi\tilde{\partial}^i\psi + \tilde{\partial}^i\phi\partial_i\psi. \quad (12)$$

Thus, the strong constraint is a consequence of the condition on  $T^*\Pi A$  being the Drinfel'd double of a Lie bialgebroid.

# Conclusions and outlook

Symplectic  
supermanifolds and  
the gauge algebra of  
double field theory

Andreas Deser<sup>1</sup> and  
Jim Stasheff<sup>2</sup>

Interpreting double scalars and double vector fields as functions on the Drinfel'd double of a Lie bialgebroid enabled us to

- ▶ Give a mathematical interpretation of "double fields".
- ▶ Express the C-bracket of DFT by Poisson brackets on  $T^*\Pi A$  and thus identify it as a Courant bracket.
- ▶ Get the strong constraint as a consequence of the structure of  $T^*\Pi A$ .

Lots of work ahead:

- ▶ Interpretation of  $O(d, d)$  transformations on the Drinfel'd double
- ▶ What are the non-geometric fluxes in this framework?
- ▶ Relation to BFV and BV theories?
- ▶  $\alpha'$ -corrections to double field theory?
