Introduction

Technical overview

Results

Conclusion

# Motivation

---

- Testing the Standard Model
- Anomalous triple gauge coupling  $WW\gamma \rightarrow$  deviation from SM  
→ new interactions
- Search of new particles that decay to  $W\gamma$   
→ background for new physics

# Overview

---

## Leading-order cross section

- for on-shell (stable) W bosons [Brown,Sahdev,Mikaelian '79]

# Overview

---

## Leading-order cross section

- for on-shell (stable) W bosons [Brown,Sahdev,Mikaelian '79]

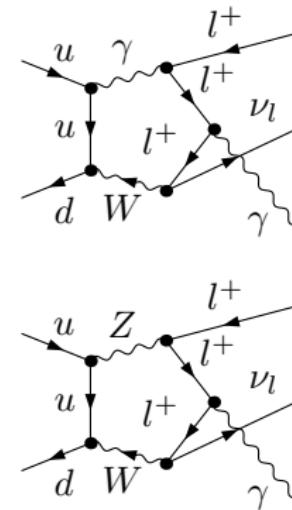

## QCD corrections

- on-shell W bosons [Smith,Thomas, van Neerven '89; Ohnemus '93]
- including leptonic decays in narrow-width approximation and anomalous couplings [Baur,Han,Ohnemus '93]
- full NLO QCD amplitudes including leptonic decays [Dixon,Kunszt,Signer '98]
  - Monte Carlo Program with leptonic decays in NWA [Florian,Signer '00]
  - also available in MCFM [Campbell,Ellis,Williams '11]
- first results of complete NNLO calculation [Grazzini '14]

# Overview

## EW corrections

- $q\bar{q}$ -channel in Leading-Pole Approximation,  
Pentagons in Extended Soft Photon  
Approximation → POLE [Accomando,Denner,Meier '05]
- Several open tasks:
  - inclusion of all off-shell effects
  - photon-induced contributions
  - non-collinear-safe observables

---

Introduction

Technical overview

Results

Conclusion

## Technical overview

---

### virtual EW corrections

- 280 one-loop diagrams up to pentagons (50 boxes, 16 pentagons)
- resonant W-boson propagators → complex-mass scheme

[Denner,Dittmaier '06]

# Technical overview

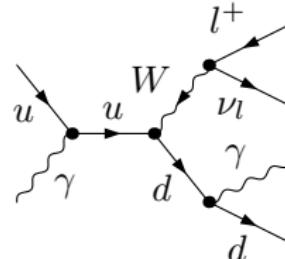

## virtual EW corrections

- 280 one-loop diagrams up to pentagons (50 boxes, 16 pentagons)
- resonant W-boson propagators → complex-mass scheme

[Denner,Dittmaier '06]

## photon-induced contributions

- photon-PDFs necessary  
→  $\mathcal{O}(\alpha)$ -corrected NNPDF2.3QED
- well defined separation between  $W + \gamma$   
and  $W + \text{jet}$  needed

# Technical background

---

## Details of calculations:

- Matrix element generation based on Feynman diagrams
- Code based on the program **Pole** [Accomando,Denner,Meier '05]  
→ based on **FormCalc** and **Feynarts** [Hahn,Perez-Victoria '99],[Hahn '01]
- Integration: Monte-Carlo-Generator **LUSIFER** [Dittmaier,Roth '02]
- Scalar integrals: **COLLIER** [Denner,Dittmaier,Hofer '14]
- Second independent calculation → Freiburg group

# Technical background

---

## Details of calculations:

- Matrix element generation based on Feynman diagrams
- Code based on the program **Pole** [Accomando,Denner,Meier '05]  
→ based on **FormCalc** and **Feynarts** [Hahn,Perez-Victoria '99],[Hahn '01]
- Integration: Monte-Carlo-Generator **LUSIFER** [Dittmaier,Roth '02]
- Scalar integrals: **COLLIER** [Denner,Dittmaier,Hofer '14]
- Second independent calculation → Freiburg group

## Soft and collinear singularities:

- IR singularities → Dipole subtraction formalism  
(collinear-safe and non-collinear-safe observables)
- Collinear photon–jet configurations → Quark-to-photon fragmentation function
- Initial-state singularities factorized into renormalized PDFs

## Collinear-safe vs. non-collinear-safe observables

---

**collinear-safe:** (final-state electrons)

- collinear fermion-photon system is treated as one particle
- sum of fermion and photon momentum enter phase-space cuts and is used for histogram binning  
⇒ recombination
- full integration over energy fraction of the photon in the fermion-photon system

## Collinear-safe vs. non-collinear-safe observables

---

### **collinear-safe:** (final-state electrons)

- collinear fermion-photon system is treated as one particle
- sum of fermion and photon momentum enter phase-space cuts and is used for histogram binning
  - ⇒ recombination
- full integration over energy fraction of the photon in the fermion-photon system

### **non-collinear-safe:** (final-state muons) [Dittmaier,Kabelschacht,Kasprzik '08]

- not all photons around a charged particle are treated inclusively
- phase-space cut on energy fraction of the photon for a fixed cone around the fermion
  - ⇒  $\alpha \ln m_f$  contributions remain in the integral

---

Introduction

Technical overview

Results

Conclusion

## General setup

---

**NLO-QCD-corrected cross section:**

$$\sigma^{\text{NLO QCD}} = \sigma^0 + \Delta\sigma^{\text{NLO QCD}},$$

$$\Delta\sigma^{\text{NLO QCD}} = \sigma_{\text{real}}^{\alpha_s} + \sigma_{\text{virt}}^{\alpha_s} + \sigma_{\text{col}}^{\alpha_s} + \sigma_{\text{frag}}^{\alpha_s}.$$

## General setup

---

**NLO-QCD-corrected cross section:**

$$\sigma^{\text{NLO QCD}} = \sigma^0 + \Delta\sigma^{\text{NLO QCD}},$$

$$\Delta\sigma^{\text{NLO QCD}} = \sigma_{\text{real}}^{\alpha_s} + \sigma_{\text{virt}}^{\alpha_s} + \sigma_{\text{col}}^{\alpha_s} + \sigma_{\text{frag}}^{\alpha_s}.$$

**EW corrections:**

$$\Delta\sigma_{q\bar{q}}^\alpha = \sigma_{q\bar{q},\text{real}}^\alpha + \sigma_{q\bar{q},\text{virt}}^\alpha + \sigma_{q\bar{q},\text{col}}^\alpha,$$

$$\Delta\sigma_{q\gamma}^\alpha = \sigma_{q\gamma,\text{real}}^\alpha + \sigma_{q\gamma,\text{col}}^\alpha + \sigma_{q\gamma,\text{frag}}^\alpha.$$

## General setup

---

### NLO-QCD-corrected cross section:

$$\sigma^{\text{NLO QCD}} = \sigma^0 + \Delta\sigma^{\text{NLO QCD}},$$

$$\Delta\sigma^{\text{NLO QCD}} = \sigma_{\text{real}}^{\alpha_s} + \sigma_{\text{virt}}^{\alpha_s} + \sigma_{\text{col}}^{\alpha_s} + \sigma_{\text{frag}}^{\alpha_s}.$$

### EW corrections:

$$\Delta\sigma_{q\bar{q}}^\alpha = \sigma_{q\bar{q},\text{real}}^\alpha + \sigma_{q\bar{q},\text{virt}}^\alpha + \sigma_{q\bar{q},\text{col}}^\alpha,$$

$$\Delta\sigma_{q\gamma}^\alpha = \sigma_{q\gamma,\text{real}}^\alpha + \sigma_{q\gamma,\text{col}}^\alpha + \sigma_{q\gamma,\text{frag}}^\alpha.$$

### Combination of QCD and EW corrections:

$$\sigma^{\text{NLO}} = \sigma^{\text{LO}} (1 + \delta_{\text{QCD}}) (1 + \delta_{\text{EW},q\bar{q}} + \delta_{\text{EW},q\gamma}),$$

$$\delta_{\text{QCD}} = \frac{\sigma^{\text{NLO QCD}} - \sigma^{\text{LO}}}{\sigma^{\text{LO}}}, \quad \delta_{\text{EW},q\bar{q}} = \frac{\Delta\sigma_{q\bar{q}}^\alpha}{\sigma^0}, \quad \delta_{\text{EW},q\gamma} = \frac{\Delta\sigma_{q\gamma}^\alpha}{\sigma^0}.$$

## Results for total cross section

---

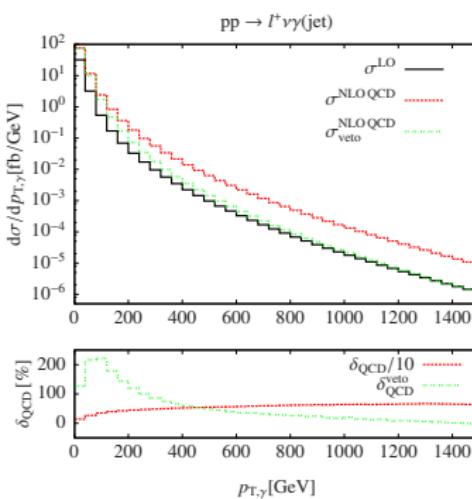

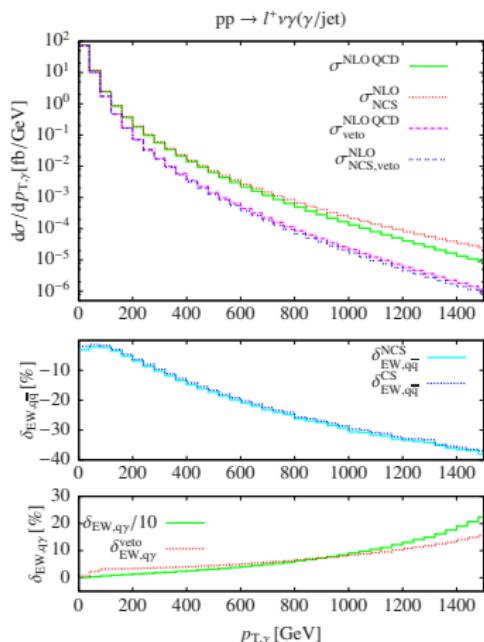

$pp \rightarrow l^+ \nu_l \gamma + X$

$\sqrt{s}$ / TeV	7	8	14
$\sigma^{\text{LO}} / \text{fb}$	1037.28(5)	1157.10(5)	1447.99(4)
$\delta_{\text{EW}, q\bar{q}}^{\text{NCS}} / \%$	-3.15	-3.14	-3.15
$\delta_{\text{EW}, q\bar{q}}^{\text{CS}} / \%$	-1.95	-1.94	-1.95
$\delta_{\text{EW}, q\gamma} / \%$	1.04	1.10	1.30
$\delta_{\text{veto EW}, q\gamma} / \%$	0.74	0.76	0.84
$\delta_{\text{QCD}} / \%$	122.33(4)	128.30(5)	153.61(3)
$\delta_{\text{QCD veto}} / \%$	112.47(4)	117.15(5)	135.97(9)

[Denner, Dittmaier, Hecht, Pasold in prep.]

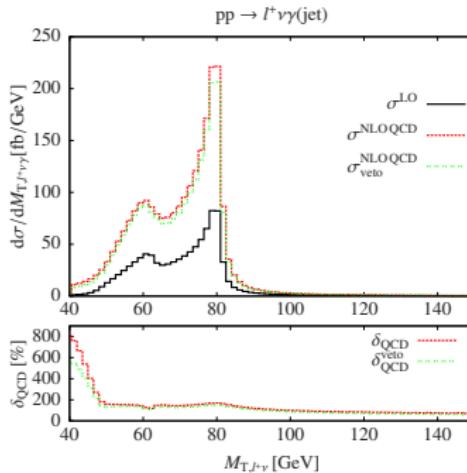

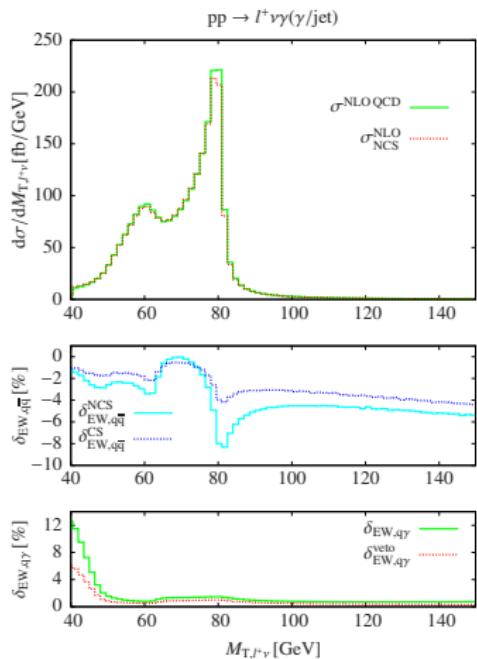

PDFs with photonic contributions: NNPDF2.3QED NLO [arxiv:1308.0598]  
Standard cuts motivated by ATLAS [arXiv:1407.8150] and CMS [arXiv:1308.6832]

# Transverse momentum distribution for photon

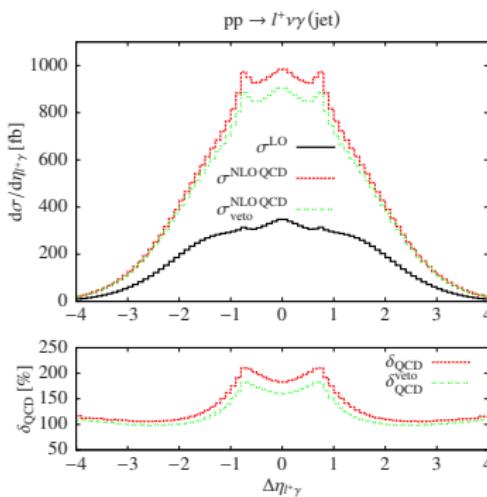

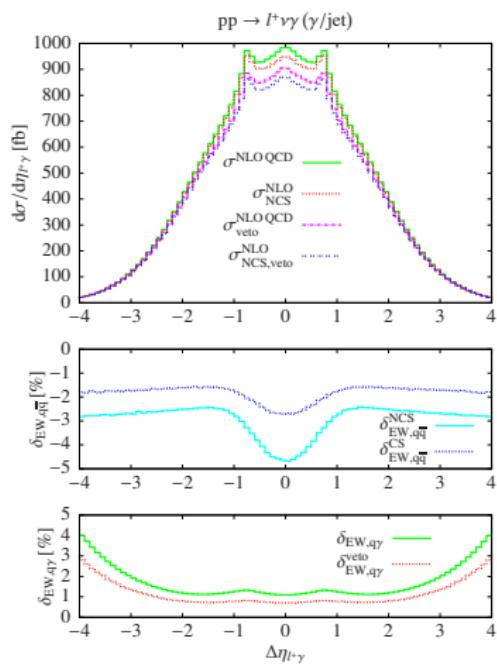

- Large QCD corrections
- Large corrections from  $q\gamma$  → reducible by jet veto
- Jet veto:  $q\bar{q}$ -induced EW corrections are dominating

# Transverse mass distribution lepton–neutrino pair

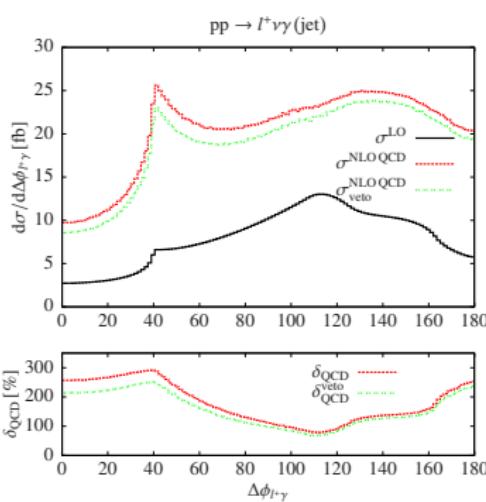

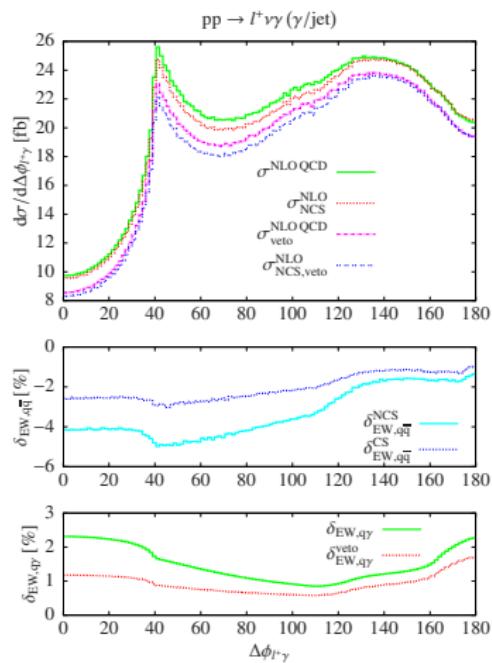

- Peak around 60 GeV
- QCD corrections  $\mathcal{O}(150\%)$
- EW corrections up to  $-8\%$

# Rapidity difference for charged lepton and photon

- QCD corrections up to 200%  
→ large shape distortions
- EW corrections up to 5%  
→ large shape distortions

# Azimuthal angle difference for lepton and photon

- QCD corrections up to 300%  
→ large shape distortions
- EW corrections up to 5%

---

Introduction

Technical overview

Results

Conclusion

# Conclusion

---

- full calculation of NLO corrections to  $W + \gamma$  production
  - all off-shell effects are included
  - including photon-induced contributions
  - Dipole subtraction for collinear-safe and non-collinear-safe observables
  - Quark-to-photon fragmentation function  
→ well defined separation between  $W + \gamma$  and  $W + \text{jet}$
- huge QCD corrections → NNLO corrections necessary
- sizeable EW corrections ( $p_T$  distributions) with / without jet veto
