

*Object-Oriented Analysis  
and Design  
for Physics Programming*

# 1 Introduction to OOAD

- 1.1 Overview and Schedule
- 1.2 What is OOAD?
- 1.3 Why OOAD?
- 1.4 Complex Systems
- 1.5 The Object Model

# 1.1 Schedule

- |                        |           |
|------------------------|-----------|
| 1) Introduction        | Monday    |
| 2) UML for OOAD        | Tuesday   |
| 3) OO Design: Classes  | Wednesday |
| 4) OO Design: Packages | Thursday  |
| 5) OO Analysis         | Friday    |

# 1.1 Literature

Not an exhaustive list, but what the lectures are based on

Object-Oriented Analysis and Design with Applications, G. Booch, 2<sup>nd</sup> Ed., Benjamin/Cummings, 1994\*

Object Solutions, G. Booch, Addison-Wesley, 1995

The Unified Modeling Language User Guide, G. Booch, J. Rumbaugh, I. Jacobson, Addison-Wesley, 1999

Agile Software Development: Principles, Patterns and Practices, R. C. Martin, Prentice Hall, 2003<sup>&</sup>

\* 3<sup>rd</sup> Ed. announced for June 2004

& partially available as articles at [www.oma.com](http://www.oma.com)

# 1.1 Expectations

- Who are we?
- What do you expect from this class?
- Have you attended other courses/classes?
- What is your programming experience?
- Do you have a current project?

# 1.2 What is OO?

- A method to design and build large programs with a long lifetime
  - e.g.  $O(10k)$  loc C++ with  $O(a)$  lifetime
  - Blueprints of systems before coding
  - Iterative development process
  - Maintenance and modifications
  - Control of dependencies
  - Separation into components

# 1.2 Just another paradigm?

- Object-orientation closer to real-life problems (physical and non-physical)
- These problems generally don't come formulated in a procedural manner
- We think in terms of “objects” or concepts and relations between those concepts
- Modelling is simplified with OO because we have objects and relations

# 1.2 SA/SD and OO

Top-down hierarchies of function calls and dependencies

Bottom-up hierarchy of dependencies

# 1.2 Common Prejudices

- OO was used earlier without OO languages
  - Doubtful. A good procedural program may deal with some of the OO issues but not with all
  - OO without language support is at least awkward and dangerous
- It is just common sense and good practices
  - It is much more than that, it provides formal methods, techniques and tools to control analysis, design, development and maintainance

# 1.3 Why OOAD?

- Software complexity rises exponentially:
  - 80's  $O(10-100)$  kloc (e.g. JADE)
  - 90's  $O(100)$  kloc (e.g. OPAL)
  - 00's  $O(1)$  Mloc (e.g. BaBar, ATLAS)
- Need for tools to deal with complexity → OOAD provides these tools

# 1.3 Software in HEP Experiments

## JADE

MAGNETDETEKTOR  
MAGNET DETECTOR

- 1 Strahlrohrzähler BEAM PIPE COUNTERS
- 2 Endseitige Bleiglaszähler END PLUG LEAD GLASS COUNTERS
- 3 Drucktank PRESSURE TANK
- 4 Myon-Kammern MUON CHAMBERS
- 5 Jet-Kammern JET CHAMBERS
- 6 Flugzeit-Zähler TIME OF FLIGHT COUNTERS
- 7 Spule COIL
- 8 Zentrale Bleiglaszähler CENTRAL LEAD GLASS COUNTERS
- 9 Magnetjoch MAGNET YOKE
- 10 Myon-Filter MUON FILTERS
- 11 Beweglicher Endstopfen REMOVABLE END PLUG
- 12 Strahlrohr BEAM PIPE
- 13 Vorwärts-Detektor TAGGING COUNTER
- 14 Mini-Beta-Quadrupol MINI BETA QUADRUPOLE
- 15 Fahrwerk MOVING DEVICES

Gesamtgewicht TOTAL WEIGHT: ~1200 t  
Magnetfeld MAGNETIC FIELD: 0.5 T  
Beteiligte Institute PARTICIPANTS  
DESY, Hamburg, Heidelberg,  
Lancaster, Manchester,  
Rutherford Lab, Tokio

80's O(100) kloc, 2000 routines,  
14 packages

90's 500 kloc, 6900 routines, 54 packages

## OPAL

# 1.3 Software in HEP Experiments

BaBar

00's O(1) Mloc, O(10k) classes,  
O(1k) packages

ATLAS

00's O(1) Mloc, O(1k) classes,  
O(100) packages

# 1.3 Why OOAD in Physics?

- Physics is about modelling the world:
  - Objects interact according to laws of nature: particles/fields, atoms, molecules and electrons, liquids, solid states, ...
- OOAD model: objects and interactions
  - This way of thinking about software is well adapted and quite natural to physicists
- OOAD is a software engineering practice
  - manage large projects professionally

# 1.4 Complex Systems

- For our purpose complex systems (Booch):
  - have many states, i.e. large "phase space",
  - are hard to comprehend in total
  - hard to predict
- Examples:
  - ant colony, an ant
  - computer
  - weather
  - a car

# 1.4 Complex Systems

- Attributes of complex systems
  - hierarchical
  - components
  - primitive components
  - few kinds of subsystems in many different combinations
  - evolved from a simpler system

# 1.4 Complex Systems: Hierarchical

- Composed of interrelated subsystems
  - subsystems consist of subsystems too
  - until elementary component

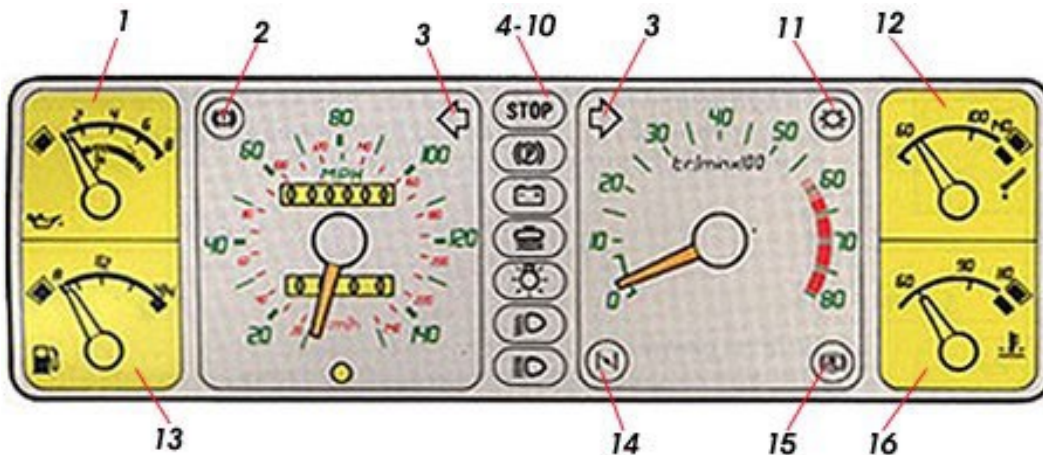

# 1.4 Complex Systems: Components

- Links (dependencies) within a component are stronger than between components
  - inner workings of components separated from interaction between components
  - service/repair/replace components

# 1.4 Complex Systems: Primitive Components

- There are primitive components
  - but definition of primitive may vary
  - Nuts, bolts, individual parts?
  - replaceable components?

Instrument panel  
or screws, bulbs and parts?

# 1.4 Complex Systems: Few kinds of subsystems in many combinations

- There are common patterns
  - Nuts, bolts, screws interchangeable
  - cables, bulbs, plugs
  - toothwheels, belts, chains
  - hoses, clamps

# 1.4 Complex Systems: Evolved from a simpler system

- Complex system designed from scratch rarely works
- Add new functionality/improvements in small steps

# 1.4 Complex Systems: Analysis

- Have we seen it before?
- Have we seen its components before?
- Decompose by functionality (“part of”)
  - Engine, brakes, wheels, lighting
- Decompose by component classes (“is a”)
  - The BX A8A Turbodiesel is an engine
  - Lockheed disk brake is a brake
  - 175/65R14 tire+rim is a wheel

# 1.4 Complex Systems: Two orthogonal views

- The *Object Structure*
  - “part of” hierarchy, functions
  - concentrate on actual components
  - concrete
- The *Class Structure*
  - “is a” hierarchy
  - concentrate on kinds of components
  - abstract

# 1.4 Complex Systems: Summary

- Have “large phase space”
- Hard to predict behaviour
- Five properties:
  - hierarchies, components, primitives, not too many kinds of components, evolved
- Two orthogonal views for analysis:
  - Object Structure (“part of”)
  - Class Structure (“is a”)

# 1.5 The Object Model

- Four essential properties
  - Abstraction (Booch)
  - Encapsulation
  - Modularity
  - Hierarchy
- Two more useful properties
  - Type
  - Persistence

# 1.5 Abstraction

The characteristics of an object which make it unique and reflect an important concept

Jackson Pollock, She-Wolf, 1943

(following  
Booch)

# 1.5 Encapsulation

Separates interface of an abstraction  
from its implementation

Abstraction:

car

Interface:

steering, pedals,  
controls

Implementation:

you don't need to  
know, quite different  
between different  
makes or models

# 1.5 Modularity

Property of a system decomposed into cohesive and loosely coupled modules

Cohesive:

group logically related  
abstractions

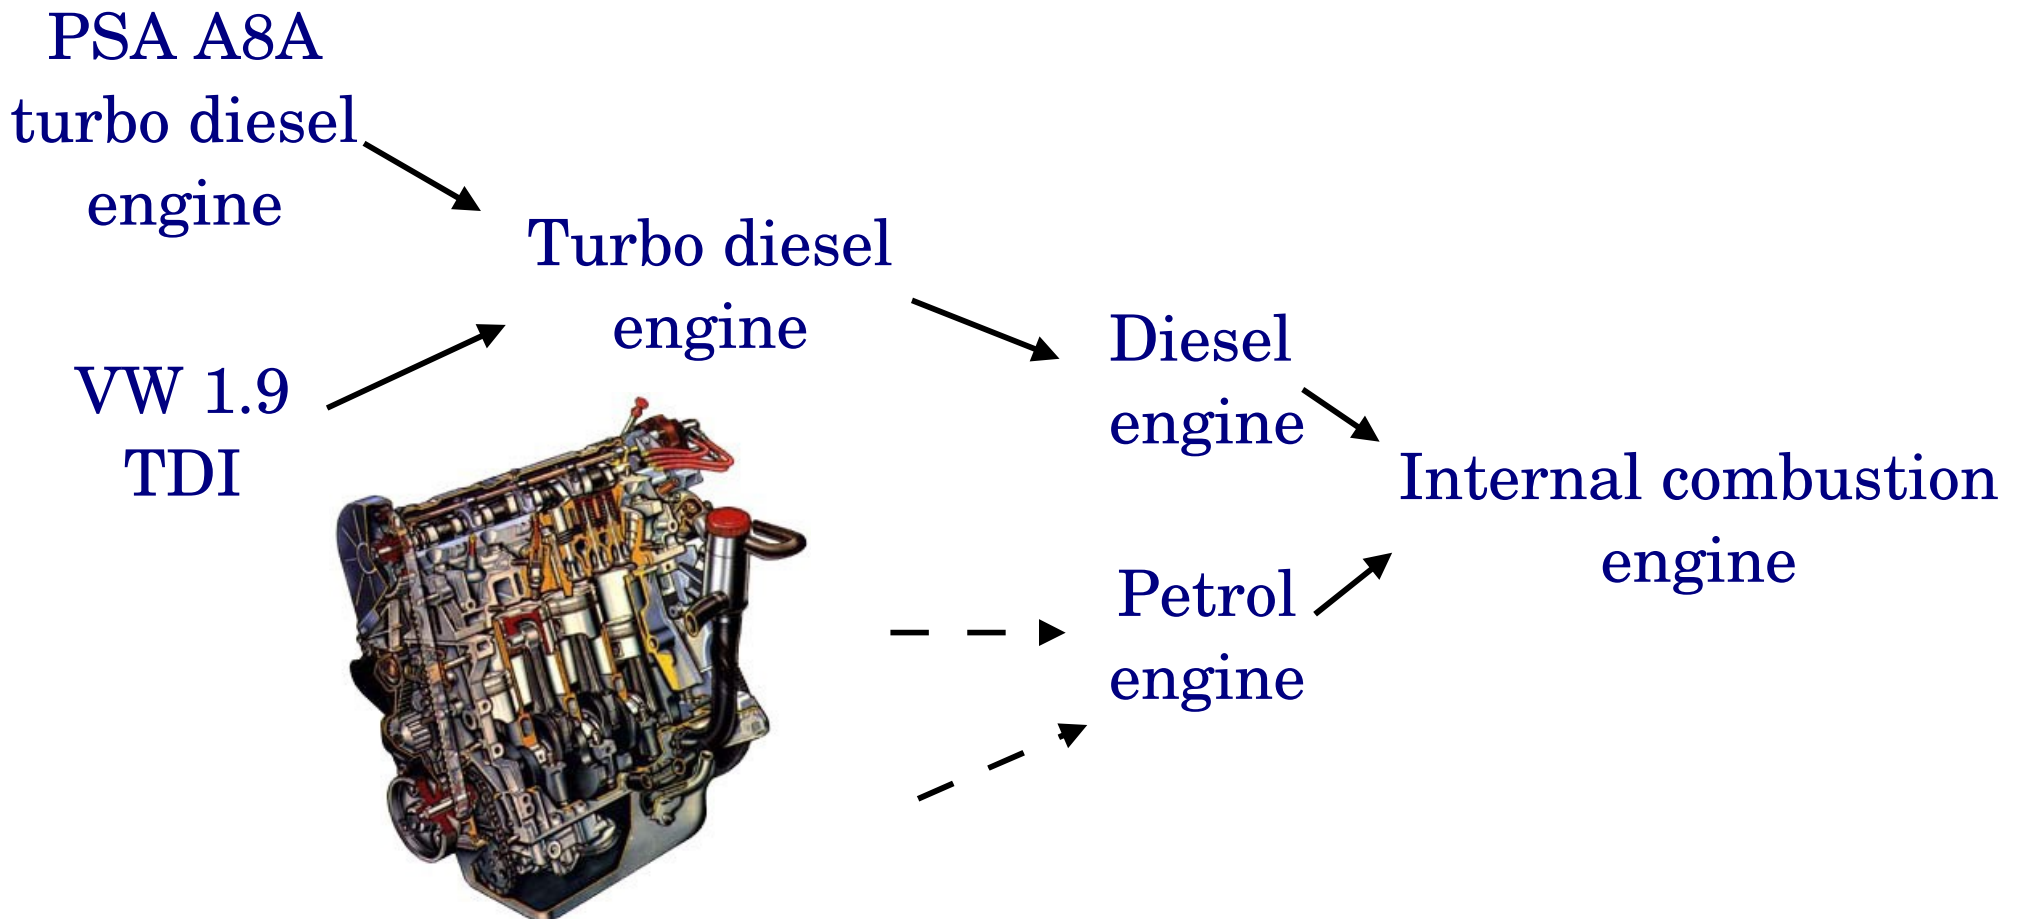

Loosely coupled:

minimise dependencies  
between modules

# 1.5 Hierarchy

Hierarchy is a ranking or ordering of abstractions

# 1.5 Type

Typing enforces object class such that objects of different class may not be interchanged

Strong typing:	operation upon an object must be defined
Weak typing:	can perform operations on any object
Static typing:	names bound to types (classes) at compile time
Dynamic typing:	names bound to objects at run time
Static binding:	names bound to objects at compile time
Dynamic binding:	names bound to objects at run time
C++, Java:	strong+static typing + dynamic binding
Python:	strong+dynamic typing
Perl:	weak+dynamic typing
Fortran, C:	strong+static typing + static binding (except casts)
