Dark matter

Leptogenesis

Standard Model (SM) extended by three heavy singlet neutrino fields $N_i = N_i^c$, $i = 1, 2, 3$ with Majorana masses $\hat{M} = \text{diag}(M_i)$ in the mass eigenbasis

$$\mathcal{L} = \mathcal{L}_{SM} + \frac{1}{2} \bar{N} i \partial^\mu N - \frac{1}{2} \bar{N} \hat{M} N - \bar{\ell} \tilde{\phi} h P_R N - \bar{N} P_L h^\dagger \tilde{\phi}^\dagger \ell$$

Light neutrino masses via seesaw mechanism

$$m_\nu = -v_{EW}^2 h \hat{M}^{-1} h^T$$

$$0.06\text{eV} \lesssim \sum m_\nu \lesssim 0.23\text{eV} \quad \rightarrow \quad \text{TeV} \lesssim M_i \lesssim M_{GUT} \text{ for } m_e/v_{EW} < h_{ij} < 1$$

Leptogenesis

Standard Model (SM) extended by three heavy singlet neutrino fields $N_i = N_i^c$, $i = 1, 2, 3$ with Majorana masses $\hat{M} = \text{diag}(M_i)$ in the mass eigenbasis

$$\mathcal{L} = \mathcal{L}_{SM} + \frac{1}{2} \bar{N} i \not{\partial} N - \frac{1}{2} \bar{N} \hat{M} N - \bar{\ell} \not{\phi} h P_R N - \bar{N} P_L h^\dagger \not{\phi}^\dagger \ell$$

Light neutrino masses via seesaw mechanism

$$m_\nu = -v_{EW}^2 h \hat{M}^{-1} h^T$$

$$0.06\text{eV} \lesssim \sum m_\nu \lesssim 0.23\text{eV} \rightarrow \text{TeV} \lesssim M_i \lesssim M_{GUT} \text{ for } m_e/v_{EW} < h_{ij} < 1$$

Baryogenesis via leptogenesis

Fukugita, Yanagida 86

- ▶ B-violation via L-violating Majorana masses M_i
- ▶ CP-violation via Yukawa couplings $\text{Im}[(h^\dagger h)_{ij}] \neq 0$
- ▶ Out-of-equilibrium (inverse) decay $N_i \leftrightarrow \ell \phi^\dagger$ and $N_i \leftrightarrow \ell^c \phi$

$$(\Gamma_i/H)|_{T=M_i} \simeq \left. \frac{(h^\dagger h)_{ii} M_i / 8\pi}{1.66 g_* T^2 / M_{pl}} \right|_{T=M_i}$$

Leptogenesis

Standard Model (SM) extended by three heavy singlet neutrino fields $N_i = N_i^c$, $i = 1, 2, 3$ with Majorana masses $\hat{M} = \text{diag}(M_i)$ in the mass eigenbasis

$$\mathcal{L} = \mathcal{L}_{SM} + \frac{1}{2}\bar{N}i\partial N - \frac{1}{2}\bar{N}\hat{M}N - \bar{\ell}\tilde{\phi}hP_R N - \bar{N}P_L h^\dagger \tilde{\phi}^\dagger \ell$$

Light neutrino masses via seesaw mechanism

$$m_\nu = -v_{EW}^2 h \hat{M}^{-1} h^T$$

$$0.06\text{eV} \lesssim \sum m_\nu \lesssim 0.23\text{eV} \quad \rightarrow \quad \text{TeV} \lesssim M_i \lesssim M_{GUT} \text{ for } m_e/v_{EW} < h_{ij} < 1$$

Baryogenesis via leptogenesis

Fukugita, Yanagida 86

- ▶ B-violation via L-violating Majorana masses M_i ;
- ▶ CP-violation via Yukawa couplings $\text{Im}[(h^\dagger h)_{ij}] \neq 0$
- ▶ Out-of-equilibrium (inverse) decay $N_i \leftrightarrow \ell\phi^\dagger$ and $N_i \leftrightarrow \ell^c\phi$

$$(\Gamma_i/H)|_{T=M_i} \simeq \frac{\tilde{m}_i/8\pi}{1.66g_*v_{EW}^2/M_{pl}} \quad \text{where } \tilde{m}_i = v_{EW}^2(h^\dagger h)_{ii}/M_i$$

Leptogenesis

Standard Model (SM) extended by three heavy singlet neutrino fields $N_i = N_i^c$, $i = 1, 2, 3$ with Majorana masses $\hat{M} = \text{diag}(M_i)$ in the mass eigenbasis

$$\mathcal{L} = \mathcal{L}_{SM} + \frac{1}{2} \bar{N} i \not{\partial} N - \frac{1}{2} \bar{N} \hat{M} N - \bar{\ell} \not{\phi} h P_R N - \bar{N} P_L h^\dagger \not{\phi}^\dagger \ell$$

Light neutrino masses via seesaw mechanism

$$m_\nu = -v_{EW}^2 h \hat{M}^{-1} h^T$$

$$0.06\text{eV} \lesssim \sum m_\nu \lesssim 0.23\text{eV} \rightarrow \text{TeV} \lesssim M_i \lesssim M_{GUT} \text{ for } m_e/v_{EW} < h_{ij} < 1$$

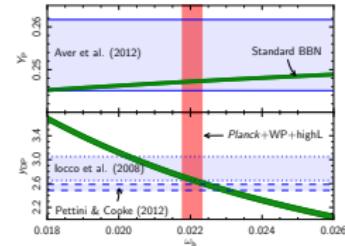

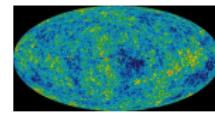

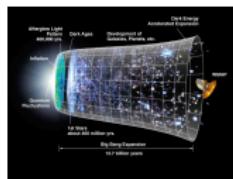

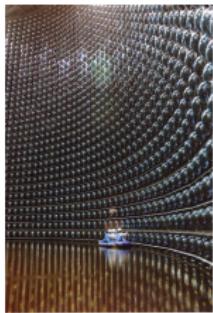

Baryogenesis via leptogenesis

Fukugita, Yanagida 86

- ▶ B-violation via L-violating Majorana masses M_i
- ▶ CP-violation via Yukawa couplings $\text{Im}[(h^\dagger h)_{ij}] \neq 0$
- ▶ Out-of-equilibrium (inverse) decay $N_i \leftrightarrow \ell \phi^\dagger$ and $N_i \leftrightarrow \ell^c \phi$

$$\begin{aligned} (\Gamma_i/H)|_{T=M_i} &\simeq \frac{\tilde{m}_i/8\pi}{1.66g_* v_{EW}^2/M_{Pl}} \quad \text{where } \tilde{m}_i = v_{EW}^2 (h^\dagger h)_{ii}/M_i \\ &\simeq \tilde{m}_i/\text{meV} \end{aligned}$$

Leptogenesis

Planck XVI 1303.5076

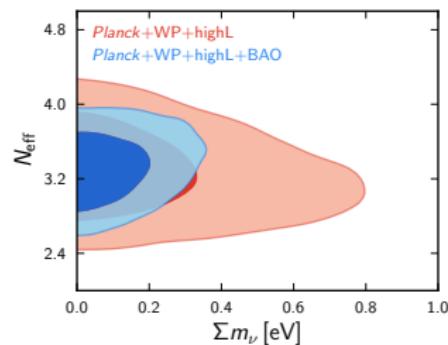

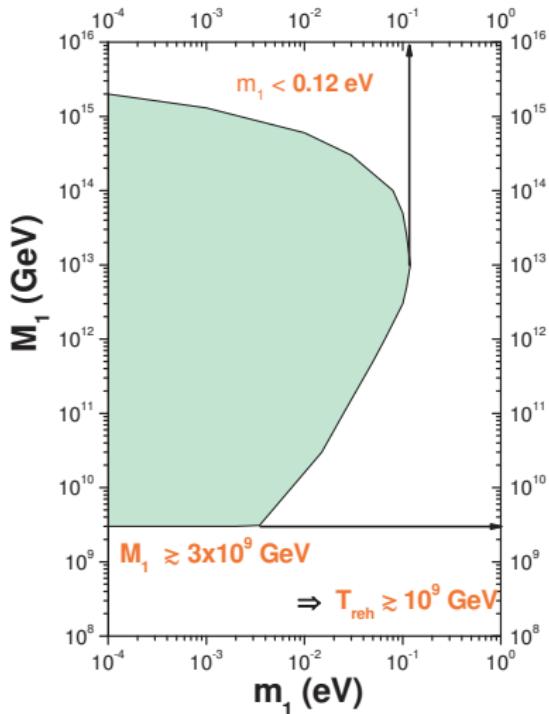

$$m_\nu, \theta_{ij}, \delta_{CP}$$

$$\eta = \frac{n_b - n_{\bar{b}}}{n_\gamma} = (6.2 \pm 0.15) \cdot 10^{-10}$$

Relation between neutrino physics and baryon asymmetry depends on

- ▶ Model building (seesaw, SO(10), ...)
- ▶ Microscopic theory for dynamics

Vanilla Leptogenesis

Di Bari 1206.3168 (unflavoured)

cf. Buchmüller, Di Bari, Plümacher 02, 03

Planck 1303.5076

L-violating decay of heavy right-handed neutrino N_i

$$\mathcal{M}_{N_i \rightarrow \ell_\alpha \phi^\dagger} = \begin{array}{c} \text{---} \\ | \\ h_{\alpha i} \\ | \\ \text{---} \end{array} + \dots$$
$$\mathcal{M}_{N_i \rightarrow \ell_\alpha^c \phi} = \begin{array}{c} \text{---} \\ | \\ h_{\alpha i}^* \\ | \\ \text{---} \end{array} + \dots$$

L-violating decay of heavy right-handed neutrino N_i

$$\mathcal{M}_{N_i \rightarrow \ell_\alpha \phi^\dagger} = \text{tree diagram } h_{i\alpha} + \text{loop diagram } h_{i\beta}^* h_{j\alpha} + \dots$$

$$\mathcal{M}_{N_i \rightarrow \ell_\alpha^c \phi} = \text{tree diagram } h_{\alpha i}^* + \text{loop diagram } h_{\beta i}^* h_{\alpha j}^* + \dots$$

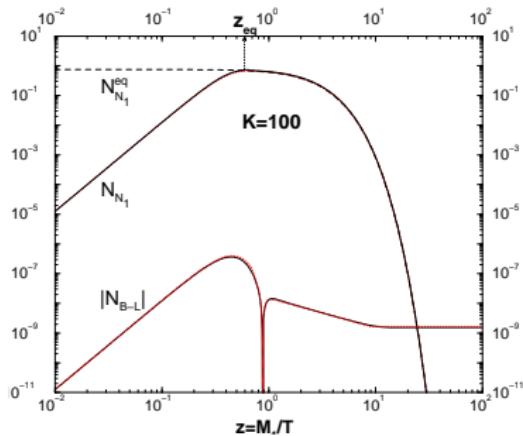

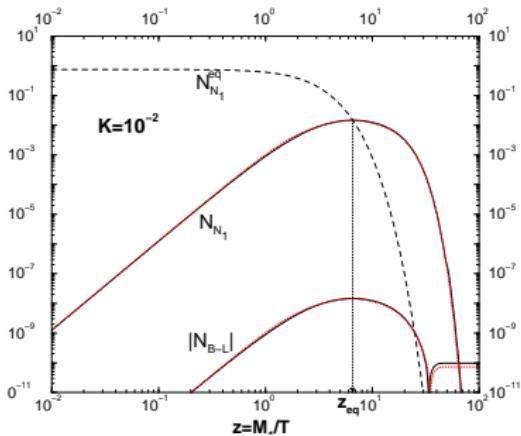

\Leftrightarrow interference of tree and **loop** processes

$$\begin{aligned} \epsilon_i &= \frac{\Gamma_{N_i \rightarrow \ell \phi^\dagger} - \Gamma_{N_i \rightarrow \ell^c \phi}}{\Gamma_{N_i \rightarrow \ell \phi^\dagger} + \Gamma_{N_i \rightarrow \ell^c \phi}} \\ &= \sum_{j \neq i} \frac{\text{Im}[(h^\dagger h)_{jj}^2]}{8\pi(h^\dagger h)_{ii}} \left\{ \frac{M_j}{M_i} \left[1 - \left(1 + \frac{M_j^2}{M_i^2} \right) \ln \left(1 + \frac{M_i^2}{M_j^2} \right) \right] + \frac{M_i M_j}{M_i^2 - M_j^2} \right\} \\ \epsilon_1 &\lesssim 10^{-6} \frac{M_1}{10^{10} \text{GeV}} \frac{m_{\text{atm}}}{m_{\nu_1} + m_{\nu_3}} \quad \text{unless} \quad \Delta M_N \ll M_N \quad \text{Davidson, Ibarra 02} \end{aligned}$$

Rate equations

$$\frac{dN_{N_i}}{dt} = - \underbrace{\Gamma_{N_i}}_{\text{equilibration rate}} (N_{N_i} - N_{N_i}^{eq})$$

$$\frac{dN_{B-L}}{dt} = \underbrace{\sum_i \Gamma_{QP,i} (N_{N_i} - N_{N_i}^{eq})}_{\text{source term}} - \underbrace{\Gamma_W N_{B-L}}_{\text{washout term}}$$

$$K = (\Gamma/H)_{T=M_N} = \tilde{m}_\nu/\text{meV}$$

Standard Boltzmann approach

$$N_L(t) = \int d^3x \sqrt{|g|} \int \frac{d^3p}{(2\pi)^3} \sum_{\ell} [f_{\ell}(t, \mathbf{x}, \mathbf{p}) - f_{\bar{\ell}}(t, \mathbf{x}, \mathbf{p})]$$

Standard Boltzmann approach

$$N_L(t) = \int d^3x \sqrt{|g|} \int \frac{d^3p}{(2\pi)^3} \sum_{\ell} [f_{\ell}(t, \mathbf{x}, \mathbf{p}) - f_{\bar{\ell}}(t, \mathbf{x}, \mathbf{p})]$$

$$\begin{aligned} p^\mu \mathcal{D}_\mu f_{\ell}(t, \mathbf{x}, \mathbf{p}) &= \sum_i \int d\Pi_{N_i} d\Pi_h \\ &\times (2\pi)^4 \delta(p_{\ell} + p_h - p_{N_i}) \\ &\times \left[|\mathcal{M}|_{N_i \rightarrow \ell\phi^\dagger}^2 f_{N_i}(1 - f_{\ell})(1 + f_{\phi}) + \dots \right. \\ &\quad \left. - |\mathcal{M}|_{\ell\phi^\dagger \rightarrow N_i}^2 f_{\ell} f_{\phi}(1 - f_{N_i}) + \dots \right] \end{aligned}$$

(Naive) LO rates

- ▶ Equilibration $\mathcal{O}(h^2)$ $(N_i \leftrightarrow \ell\phi^\dagger)_{tree}$

$$\Gamma_{N_i} = \Gamma_{N_i}^0 \left\langle \frac{M_i}{E_i} \right\rangle_T \quad \text{where } \Gamma_{N_i}^0 = \frac{(h^\dagger h)_{ii} M_i}{8\pi}$$

- ▶ Source term $\mathcal{O}(h^4)$ $(N_i \leftrightarrow \ell\phi^\dagger)_{1-loop}, \quad (\ell\phi^\dagger \leftrightarrow \ell^c\phi)_{1-loop}|_{RIS}$

$$\Gamma_{Q\bar{P},i} = \epsilon_i \Gamma_{N_i} \quad \epsilon_i = \frac{\Gamma_{N_i \rightarrow \ell\phi^\dagger} - \Gamma_{N_i \rightarrow \ell^c\phi}}{\Gamma_{N_i \rightarrow \ell\phi^\dagger} + \Gamma_{N_i \rightarrow \ell^c\phi}}$$

- ▶ Washout term $\mathcal{O}(h^2)$ $(\ell\phi^\dagger \rightarrow N_i)_{tree}$

$$\Gamma_W = \frac{8}{\pi^2} \left(c_\ell + \frac{c_\phi}{2} \right) N_{N_i}^{eq} \Gamma_{N_i} \quad \text{where } c_{\ell(\phi)} = -\frac{N_{\ell(\phi)}}{N_{B-L}}$$

Beyond the vanilla case

- ▶ Other models (type-II seesaw, susy, ... huge amount of literature)
see e.g. review Nir Nardi Davidson 0802.2962; Di Bari 1211.0512
- ▶ Check the mechanism (interference+nonequilibrium)

Beyond the vanilla case

- ▶ Other models (type-II seesaw, susy, ... huge amount of literature)
see e.g. review Nir Nardi Davidson 0802.2962; Di Bari 1211.0512
- ▶ Check the mechanism (interference+nonequilibrium)
- ▶ Compute coefficients more precisely
 - ▶ Equilibration rate (\leftrightarrow production rate at LO in N-Yukawa h)
 - ▶ Washout

Beyond the vanilla case

- ▶ Other models (type-II seesaw, susy, ... huge amount of literature)
see e.g. review Nir Nardi Davidson 0802.2962; Di Bari 1211.0512
- ▶ Check the mechanism (interference+nonequilibrium)
- ▶ Compute coefficients more precisely
 - ▶ Equilibration rate (\leftrightarrow production rate at LO in N-Yukawa h)
 - ▶ Washout
- ▶ Take qualitatively new effects into account (extend/scrutinize equations)
 - ▶ Active lepton flavor effects

$$\ell_\tau \leftrightarrow \tau_R \phi \quad \text{vs} \quad (h_{1e}\ell_e + h_{1\mu}\ell_\mu + h_{1\tau}\ell_\tau)\phi \leftrightarrow N_1$$

- ▶ N_i flavor effects (resonant enhancement, oscillations)

$$\epsilon_{N_i}^{wave} = \frac{\text{Im}[(h^\dagger h)_{12}^2]}{8\pi(h^\dagger h)_{ii}} \times \frac{M_1 M_2}{M_2^2 - M_1^2}$$

- ▶ Partial flavor/spectator equilibration
- ▶ Kinetic non-equilibrium for RH neutrinos

Techniques

- ▶ Compute coefficients more precisely
 - (1) Add processes to Boltzmann eq. ($tN \leftrightarrow \ell\phi$)
Include thermal masses in kinematics
 - (2) Map rates to thermal correlation functions/suszeptibilities
Consistent expansion in g, y_t for $M_N/T \sim g, 1, \gg 1$
 \rightarrow *rate when kinematics would lead to thermal blocking,
cancellation of IR div. at $T \neq 0$*

Techniques

- ▶ Compute coefficients more precisely
 - (1) Add processes to Boltzmann eq. ($tN \leftrightarrow \ell\phi$)
Include thermal masses in kinematics
 - (2) Map rates to thermal correlation functions/suszeptibilities
Consistent expansion in g, y_t for $M_N/T \sim g, 1, \gg 1$
 \rightarrow rate when kinematics would lead to thermal blocking,
cancellation of IR div. at $T \neq 0$
- ▶ Take qualitatively new effects into account (extend/scrutinize equations)
 - (1) Boltzmann eqs.

$$N_{B-L} \rightarrow N_{B-\frac{1}{3}L_\alpha} \quad N_{N_1} \rightarrow N_{N_i}$$

- (2) Density matrix equations

$$N_{B-L} \rightarrow \rho_{\alpha\beta} \quad N_{N_1} \rightarrow \rho_{ij}$$

- (3) Derive kinetic equations based on CTP/Kadanoff-Baym

$$N_{B-L} \rightarrow \langle \ell_\alpha \ell_\beta \rangle \quad N_{N_1} \rightarrow \langle N_i \bar{N}_j \rangle$$

\rightarrow basis-independent, derive structure of eqs. from 1st principles,
no RIS needed

Equilibration (production) rate

Boltzmann ('naive' NLO in SM couplings (g , y_t); LO in N-yukawa)

$$2 \leftrightarrow 2 \quad AN \leftrightarrow \ell h, tN \leftrightarrow \ell h, \quad A = ad_{SU(2) \times U(1)}$$

$$1 \leftrightarrow 2 \quad \text{vertex+wavefctn virtual}$$

$$1 \leftrightarrow 3 \quad N \leftrightarrow \ell h A, N \leftrightarrow \ell h t$$

→ blocking of $N \leftrightarrow \ell\phi$ for $M_N \ll T$ ('LO $\rightarrow 0$ '), instead $\phi \leftrightarrow N\ell$

Equilibration (production) rate

Boltzmann ('naive' NLO in SM couplings (g , y_t); LO in N-yukawa)

$$\begin{array}{lll} 2 \leftrightarrow 2 & AN \leftrightarrow \ell h, tN \leftrightarrow \ell h, & A = ad_{SU(2) \times U(1)} \\ 1 \leftrightarrow 2 & \text{vertex+wavefctn virtual} \\ 1 \leftrightarrow 3 & N \leftrightarrow \ell h A, N \leftrightarrow \ell h t \end{array}$$

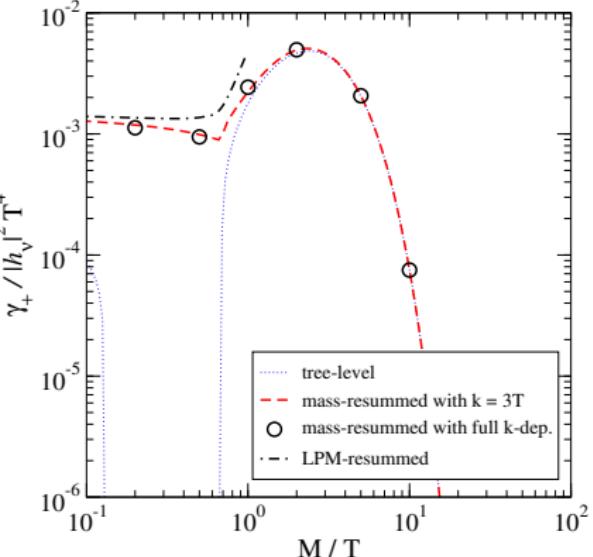

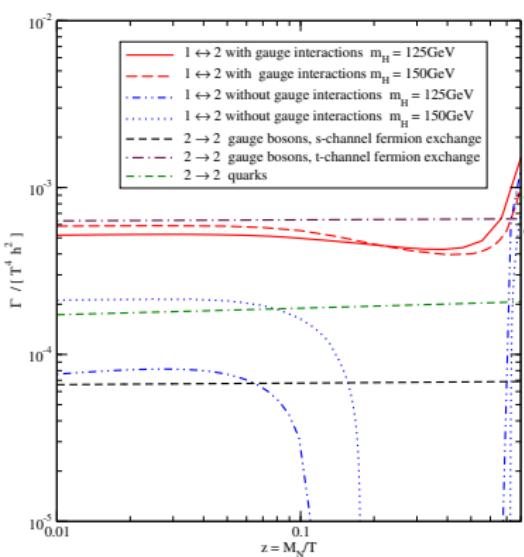

→ blocking of $N \leftrightarrow \ell\phi$ for $M_N \ll T$ ('LO → 0'), instead $\phi \leftrightarrow N\ell$

All orders in SM couplings, LO in N-yukawa,

$$\frac{d\Gamma_{N_1}}{d^3 k} = \frac{1}{(2\pi)^3 2E_k} 2f_{FD}(E_k) \text{ImTr}[\not{k} \Sigma_R(k)]_{k=(E_k+i0^+, \mathbf{k})}$$

Equation of motion

$$\frac{dn_L}{dt} = \frac{1}{V} \int_V d^3x \partial_\mu j_L^\mu(x) = -\frac{1}{V} \int_V d^3x \text{tr} [\gamma_\mu (\partial_x^\mu + \partial_y^\mu) S_\ell^{\alpha\beta}(x, y)]_{x=y}$$

CTP/Kadanoff-Baym approach to leptogenesis

$$j_L^\mu(x) = \left\langle \sum_\alpha \bar{\ell}_\alpha(x) \gamma^\mu \ell_\alpha(x) \right\rangle = -\text{tr} [\gamma^\mu S_\ell^{\alpha\beta}(x, x)]$$

Lepton asymmetry

$$n_L(t) = \frac{1}{V} \int_V d^3x j_L^0(t, x)$$

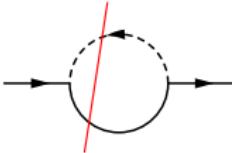

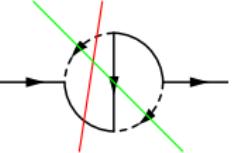

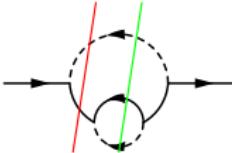

Equation of motion

$$\frac{dn_L}{dt} = \frac{1}{V} \int_V d^3x \partial_\mu j_L^\mu(x) = -\frac{1}{V} \int_V d^3x \text{tr} [\gamma_\mu (\partial_x^\mu + \partial_y^\mu) S_\ell^{\alpha\beta}(x, y)]_{x=y}$$

Use KB equations for leptons on the right-hand side \Rightarrow

$$\begin{aligned} \frac{dn_L}{dt} &= i \int_0^t dt' \int \frac{d^3 p}{(2\pi)^3} \text{tr} \left[\Sigma_{\ell_P^\alpha \mathbf{p}}^{\alpha\gamma}(t, t') S_{\ell_F^\gamma \mathbf{p}}^{\gamma\beta}(t', t) - \Sigma_{\ell_F^\alpha \mathbf{p}}^{\alpha\gamma}(t, t') S_{\ell_P^\gamma \mathbf{p}}^{\gamma\beta}(t', t) \right. \\ &\quad \left. - S_{\ell_P^\alpha \mathbf{p}}^{\alpha\gamma}(t, t') \Sigma_{\ell_F^\gamma \mathbf{p}}^{\gamma\beta}(t', t) + S_{\ell_F^\alpha \mathbf{p}}^{\alpha\gamma}(t, t') \Sigma_{\ell_P^\gamma \mathbf{p}}^{\gamma\beta}(t', t) \right] \end{aligned}$$

CTP/Kadanoff-Baym approach to leptogenesis

			
$N \leftrightarrow l\phi^\dagger$ $N \leftrightarrow l^c\phi$	$ tree ^2$	tree \times vertex-corr.	tree \times wave-corr.
$l\phi^\dagger \leftrightarrow l^c\phi$		$s \times t$	$s \times s, t \times t$

- unified description of CP-violating decay, inverse decay, scattering

CTP/Kadanoff-Baym approach to leptogenesis

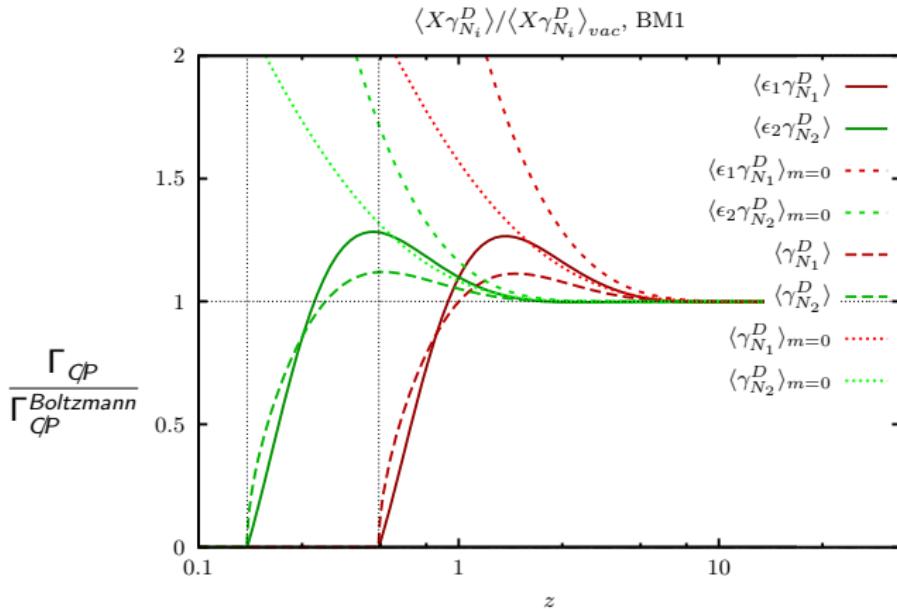

$N \leftrightarrow l\phi^\dagger$ $N \leftrightarrow l^c\phi$	$ tree ^2$	tree \times vertex-corr.	tree \times wave-corr.
$\ell\phi^\dagger \leftrightarrow \ell^c\phi$		$s \times t$	$s \times s, t \times t$

- ▶ unified description of CP-violating decay, inverse decay, scattering
- ▶ dn_L/dt vanishes in equilibrium due to KMS relations

$$S_F^{eq} = \frac{1}{2} \tanh \left(\frac{\beta k^0}{2} \right) S_\rho^{eq} \quad \Sigma_F^{eq} = \frac{1}{2} \tanh \left(\frac{\beta k^0}{2} \right) \Sigma_\rho^{eq}$$

\Rightarrow consistent equations free of double-counting problems

Hierarchical limit $M_1 \lesssim M_{2,3}$

Bose enhancement at $M_N \sim T$, suppression for large T due to thermal masses

Frossard, MG, Hohenegger, Kartavtsev, Mitrouskas 12

Symmetry quantum statistics vs thermal loop corr. important for models where

$\epsilon^{vac} = 0$ Garbrecht, Ramsey-Musolf 13, cf. also MG, Kartavtsev, Hohenegger, Lindner 09; Beneke,

Garbrecht, Herranen, Schwaller 10; Anisimov, Buchmüller, Drewes, Mendizabal 11

Flavoured treatment for $N_{1,2}$

- ▶ Statistical propagator S_F and spectral function S_ρ are matrices in N_1, N_2, N_3 flavor space. We consider the sub-space N_1, N_2 of the quasi-degenerate states.

$$S^{ij}(x, y) = \langle T_C N_i(x) \bar{N}_j(y) \rangle = \begin{pmatrix} S^{11} & \color{red}{S^{12}} \\ \color{red}{S^{21}} & S^{22} \end{pmatrix}$$

⇒ coherent $N_1 - N_2$ transitions out-of-equilibrium

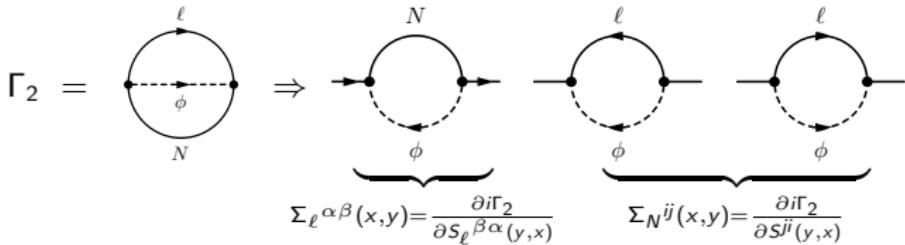

Flavoured treatment for $N_{1,2}$

- ▶ Statistical propagator S_F and spectral function S_ρ are matrices in N_1, N_2, N_3 flavor space. We consider the sub-space N_1, N_2 of the quasi-degenerate states.

$$S^{ij}(x, y) = \langle T_C N_i(x) \bar{N}_j(y) \rangle = \begin{pmatrix} S^{11} & S^{12} \\ S^{21} & S^{22} \end{pmatrix}$$

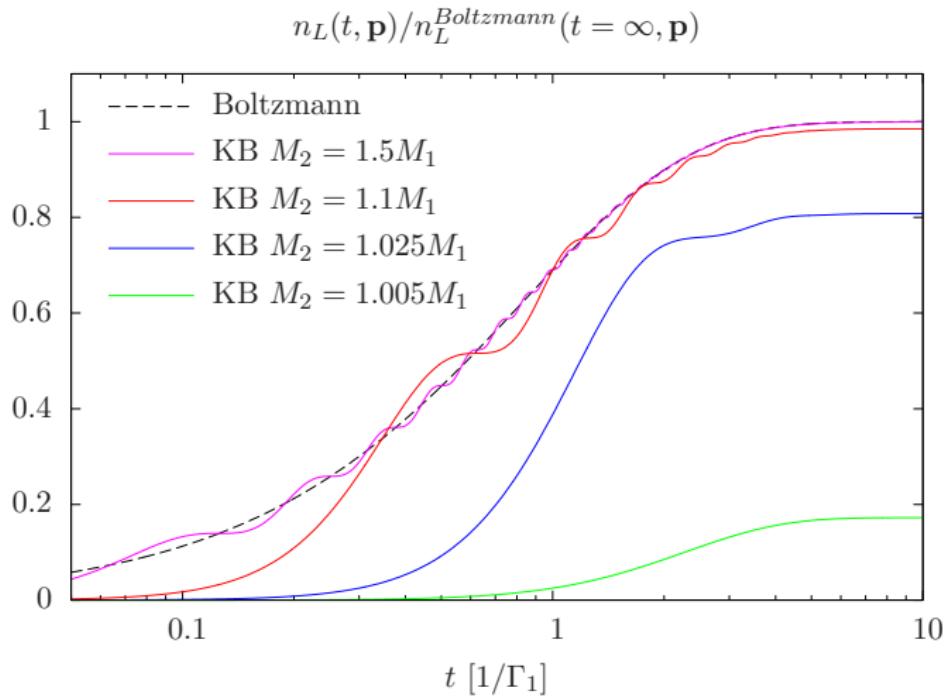

⇒ coherent $N_1 - N_2$ transitions out-of-equilibrium

- ▶ Self-energies for leptons and for Majorana neutrinos

- ▶ Important: lepton self-energy contains full Majorana propagator-matrix

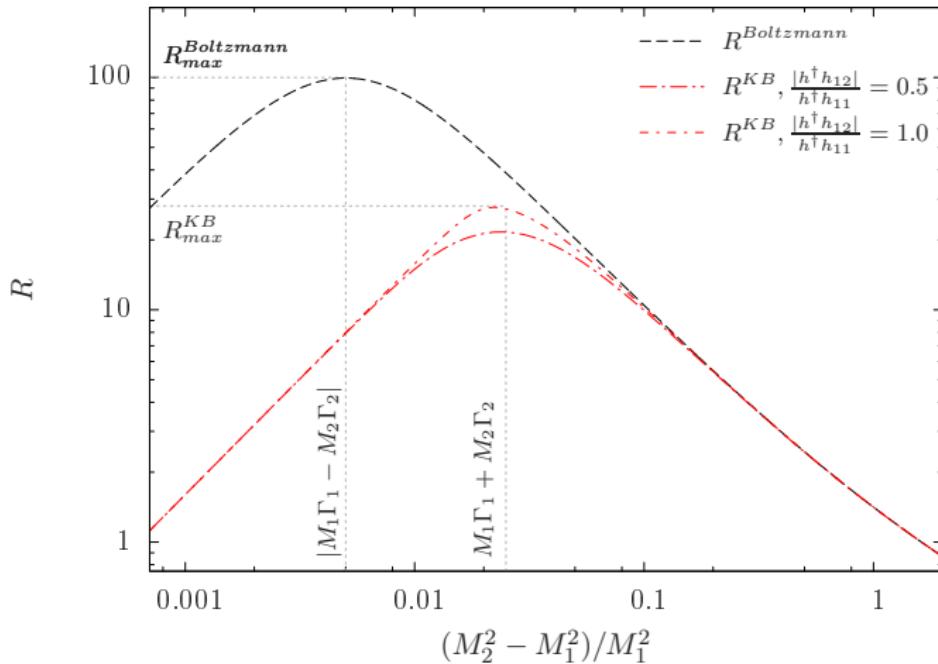

Resonant enhancement

$$\Gamma_1 = 0.01M_1, \Gamma_2 = 0.015M_1, \Gamma_{\ell\phi} \rightarrow 0$$

MG, Kartavtsev, Hohenegger Annals Phys. 328 (2013) 26

Resonant enhancement

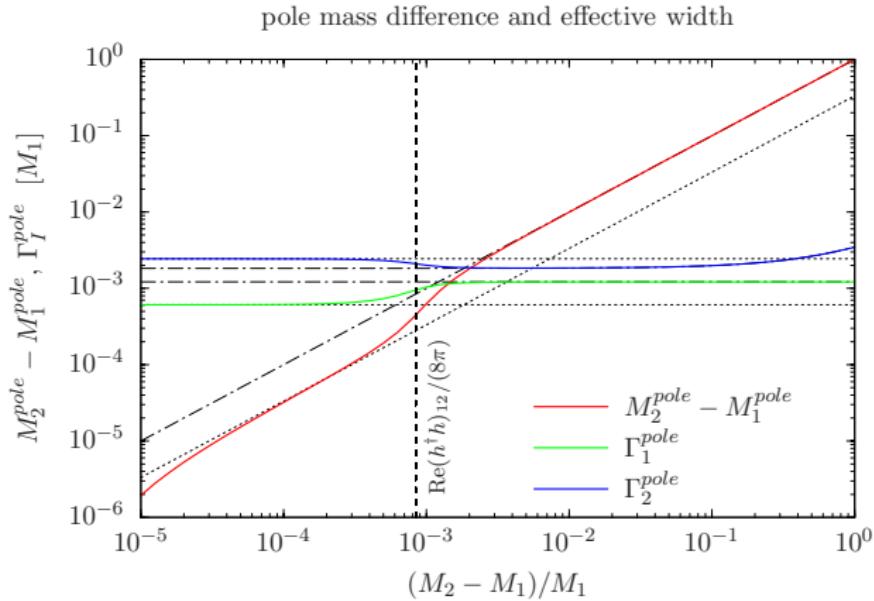

$$\Gamma_2/\Gamma_1 = 1.5$$

MG, Kartavtsev, Hohenegger Annals Phys. 328 (2013) 26

related works: Anisimov, Buchmüller, Drewes, Mendizabal Annals Phys. 326 (2011) 1998; Iso, Shimada, Yamanaka 1312.7680; Dev, Millington, Pilaftsis, Teresi 1403.1003; Iso Shimada 1404.4806; Garbrecht, Gautier, Klarić 1406.4190

BW approximation for spectral function

Effective masses $M_I^{\text{pole}} \equiv \omega_{pl}|_{\mathbf{p}=0}$ and widths $\Gamma_I^{\text{pole}} \equiv \Gamma_{pl}|_{\mathbf{p}=0}$ of the sterile Majorana neutrinos extracted from complex poles of resummed ret/adv prop. for $(h^\dagger h)_{11} = 0.03$, $(h^\dagger h)_{22} = 0.045$, $(h^\dagger h)_{12} = 0.03 \cdot e^{i\pi/4}$ and $T = 0.25M_1$.

Resonant enhancement

Resonant enhancement within the Boltzmann approach

$$R^{Boltzmann} \equiv \frac{M_1 M_2 (M_2^2 - M_1^2)}{(M_2^2 - M_1^2)^2 + A^2}$$

Resonant enhancement

Resonant enhancement within the Boltzmann approach

$$R^{Boltzmann} \equiv \frac{M_1 M_2 (M_2^2 - M_1^2)}{(M_2^2 - M_1^2)^2 + A^2}$$

Resonant enhancement within the Kadanoff-Baym approach, including coherent contributions ($|(h^\dagger h)_{12}| \ll (h^\dagger h)_{ii}$, BW approx.)

$$R^{KB}(t) = \frac{M_1 M_2 (M_2^2 - M_1^2)}{(M_2^2 - M_1^2)^2 + (M_1 \Gamma_1 - M_2 \Gamma_2)^2} \times (1 - f_{coherent}(t))$$

Resonant enhancement

Resonant enhancement within the Boltzmann approach

$$R^{Boltzmann} \equiv \frac{M_1 M_2 (M_2^2 - M_1^2)}{(M_2^2 - M_1^2)^2 + A^2}$$

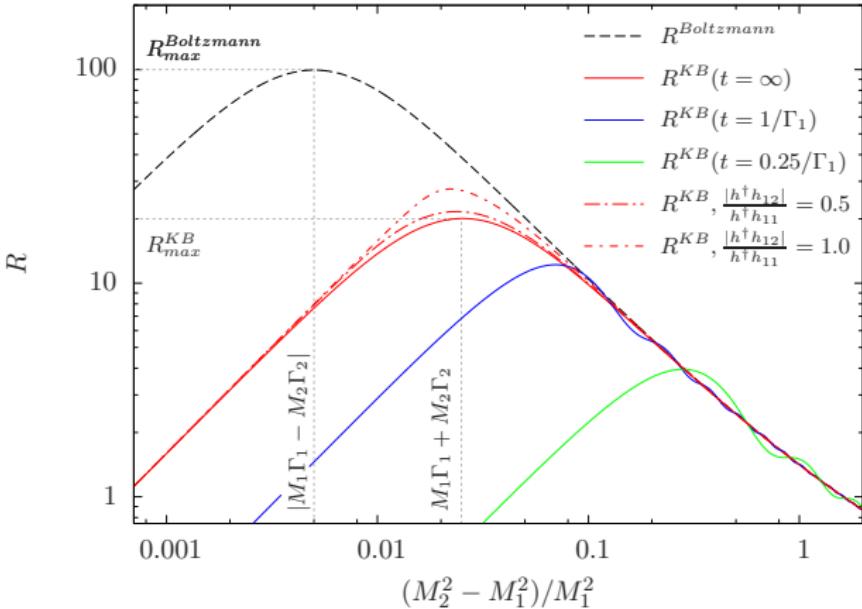

Resonant enhancement within the Kadanoff-Baym approach, including coherent contributions ($|(h^\dagger h)_{12}| \ll (h^\dagger h)_{ii}$, BW approx.)

$$R^{KB}(t) = \frac{M_1 M_2 (M_2^2 - M_1^2)}{(M_2^2 - M_1^2)^2 + (M_1 \Gamma_1 - M_2 \Gamma_2)^2} \times (1 - f_{coherent}(t))$$

Partial cancellation of Boltzmann- and coherent contribution cuts off the enhancement in the doubly degenerate limit $M_1 \rightarrow M_2$ and $\Gamma_1 \rightarrow \Gamma_2$

$$R^{KB}(t)|_{t \gtrsim 1/\Gamma_{pl}} \simeq \frac{M_1 M_2 (M_2^2 - M_1^2)}{(M_2^2 - M_1^2)^2 + (M_1 \Gamma_1 + M_2 \Gamma_2)^2}$$

Resonant enhancement

Numerical result for $|h^\dagger h_{12}| \sim h^\dagger h_{ii}$ vs BW approximation for $|h^\dagger h_{12}| \ll h^\dagger h_{ii}$

$$R_{max}^{Boltzmann} = M_1 M_2 / (2|\Gamma_1 M_1 - \Gamma_2 M_2|), \quad R_{max}^{KB} \simeq M_1 M_2 / (2(\Gamma_1 M_1 + \Gamma_2 M_2))$$

Conclusions

- ▶ Lots of progress in theory of leptogenesis
- ▶ Washout/Production NLO ($M \gtrsim T$), consistent LO ($M \sim gT$)
- ▶ CTP/Kadanoff-Baym helpful to check saturation of resonant enhancement and useful starting point for deriving (flavoured) kinetic equations

- ▶ Source term at finite T ?
- ▶ Bounds on M_N and m_ν ?
- ▶ Other models ?

Flavoured treatment for $N_{1,2}$

- ▶ Second step: Lepton asymmetry

$$\begin{aligned} n_L(t) &= i(h^\dagger h)_{ji} \int_0^t dt' \int_0^t dt'' \int \frac{d^3 p}{(2\pi)^3} \\ &\quad \text{tr} \left[P_R \underbrace{\left(\delta S_{F\mathbf{p}}^{ij}(t', t'') - \bar{\delta S}_{F\mathbf{p}}^{ji}(t', t'') \right)}_{\propto \text{ Deviation from equilibrium, CP-violation}} P_L S_{\ell\phi\rho\mathbf{p}}(t'' - t') \right] \end{aligned}$$

$$\delta \bar{S}_{F\mathbf{p}}^{ji}(t', t'') = CP \delta S_{F\mathbf{p}}^{ij}(t'', t')^T (CP)^{-1}$$

$$\delta S = S - S_{th}$$

$$\text{lepton-Higgs loop } S_{\ell\phi} = S_\ell \Delta_\phi$$

Solution of KBE

Retarded and advanced propagators

$$\begin{aligned} S_R(x, y) &= \Theta(x^0 - y^0) S_\rho(x, y) \\ S_A(x, y) &= -\Theta(y^0 - x^0) S_\rho(x, y) \end{aligned}$$

The Kadanoff-Baym equation for the statistical propagator can be written as

$$\begin{aligned} \int_0^\infty d^4 z \left[\left((i\cancel{\partial}_x - M_i) \delta^{ik} - \delta \Sigma_N{}^{ik}(x) \right) \delta(x - z) - \Sigma_{NR}{}^{ik}(x, z) \right] S_F^{kj}(z, y) \\ = \int_0^\infty d^4 z \Sigma_{NF}{}^{ik}(x, z) S_A^{kj}(z, y) \end{aligned}$$

Special solution of the inhomogeneous equation

$$S_F^{ij}(x, y)_{inhom} = - \int_0^\infty d^4 u S_R^{ik}(x, u) \int_0^\infty d^4 z \Sigma_{NF}{}^{kl}(u, z) S_A^{lj}(z, y)$$

General solution of the homogeneous equation

$$S_F^{ij}(x, y)_{hom} = - \int d^3 u S_R^{ik}(x, (0, \mathbf{u})) \int d^3 v A^{kl}(\mathbf{u}, \mathbf{v}) S_A^{lj}((0, \mathbf{v}), y)$$

Solution of KBE

Instantaneous excitation of $N_{1,2}$ at $t = 0$, lepton/Higgs = thermal bath

$$S_{F\mathbf{p}}^{ij}(t, t') = S_{F\mathbf{p}}^{ij\, th}(t - t') + \underbrace{S_{R\mathbf{p}}^{ik}(t)\gamma_0\delta S_{F\mathbf{p}}^{kl}(0, 0)\gamma_0 S_{A\mathbf{p}}^{lj}(-t')}_{\equiv \delta S_{F\mathbf{p}}^{ij}(t, t')}$$

Resummed retarded and advanced propagators

$$\begin{aligned} \left((i\not{\partial}_x - M_i) \delta^{ik} - \delta\Sigma_N^{ik}(x) \right) S_R^{ik}(x, y) &= i\gamma_0\delta(x - y) \\ &+ \int_{y^0}^{x^0} dz^0 \int d^3z \Sigma_N^{ik}_{\rho}(x, z) S_R^{kj}(z, y) \end{aligned}$$

$$\Sigma_N^{ij}_{\rho}(x, y) = -2 \left[(h^\dagger h)_{ij} P_L + (h^\dagger h)_{ji} P_R \right] S_{\ell\phi\rho}(x, y)$$

$$S_{\ell\phi\rho}(x, y) = S_{\ell F}(x, y) \Delta_{\phi\rho}(x, y) + S_{\ell\rho}(x, y) \Delta_{\phi F}(x, y)$$

BW approximation

Solve SD equation for $S_{R(A)}(p)$ in Breit-Wigner approximation:

$$S_{R(A)}^{ij}(p) \simeq \frac{Z_{1R(A)}^{ij}}{p^2 - x_1} + \frac{Z_{2R(A)}^{ij}}{p^2 - x_2}$$

with residua $Z_{IR(A)}^{ij}$ and complex poles x_I (basis independent)

$$x_{1,2} = \frac{(V \pm W)^2}{4Q^2} \equiv \left(\omega_{pl} - i \frac{\Gamma_{pl}}{2} \right)^2 - \mathbf{p}^2$$

where

$$V = \sqrt{(\eta_1 M_1(1 + i\gamma_{22}) - \eta_2 M_2(1 + i\gamma_{11}))^2 - 4\eta_1\eta_2 M_1 M_2 (\text{Re}\gamma_{12})^2}$$

$$W = \sqrt{(\eta_1 M_1(1 + i\gamma_{22}) + \eta_2 M_2(1 + i\gamma_{11}))^2 + 4\eta_1\eta_2 M_1 M_2 (\text{Im}\gamma_{12})^2}$$

$$Q = \det \Omega_{LR} = \det \Omega_{RL} = (1 + i\gamma_{11})(1 + i\gamma_{22}) + |\gamma_{12}|^2$$

$$\gamma_{ij} \simeq (h^\dagger h)_{ij} \left[\frac{\Theta(p^2)\text{sign}(p_0)}{16\pi} \left(1 + \frac{2}{e^{|p_0|/T} - 1} \right) + i \left(\frac{\ln \frac{|p^2|}{\mu^2}}{16\pi^2} + \frac{T^2}{6p^2} - \frac{T^2}{6\mu^2} \right) \right]$$

BW approximation

- ▶ Regime $(M_2 - M_1)/M_1 \gtrsim \text{Re}(h^\dagger h)_{12}/(8\pi)$

$$M_i^{pole} \simeq M_i ,$$

$$\Gamma_i^{pole} \simeq \Gamma_i \equiv \frac{(h^\dagger h)_{ii}}{8\pi} M_i \left(1 + \frac{2}{e^{M_i/T} - 1} \right)$$

- ▶ Regime $(M_2 - M_1)/M_1 \lesssim \text{Re}(h^\dagger h)_{12}/(8\pi)$

$$M_i^{pole} \simeq \frac{M_1 + M_2}{2} \pm \frac{(M_2 - M_1)((h^\dagger h)_{22} - (h^\dagger h)_{11})}{2\sqrt{((h^\dagger h)_{22} - (h^\dagger h)_{11})^2 + 4(\text{Re}(h^\dagger h)_{12})^2}} ,$$

$$\begin{aligned} \Gamma_i^{pole} \simeq & \frac{M_i}{16\pi} \left(1 + \frac{2}{e^{M_i/T} - 1} \right) \left((h^\dagger h)_{11} + (h^\dagger h)_{22} \right. \\ & \left. \pm \sqrt{((h^\dagger h)_{22} - (h^\dagger h)_{11})^2 + 4(\text{Re}(h^\dagger h)_{12})^2} \right) \end{aligned}$$

The relation between the mass- and Yukawa coupling matrices at zero and finite temperature is

$$\begin{aligned} M(T) &= (P_L Z(T)^T + P_R Z(T)^\dagger) M(T = 0) (P_L Z(T) + P_R Z(T)^*) , \\ (h^\dagger h)(T) &= Z(T)^T (h^\dagger h)(T = 0) Z(T)^* , \end{aligned}$$

where $Z_{ij}(T) \equiv V_{ik}(T)(\delta_{kj} + (h^\dagger h)_{kj} T^2/(6\mu^2))$, $V(T)^\dagger V(T) = 1$

Result for the lepton asymmetry

$$n_L(t) = \int \frac{d^3 p}{(2\pi)^9} \frac{d^3 q}{2q} \frac{d^3 k}{2k} (2\pi)^3 \delta(\mathbf{p} - \mathbf{k} - \mathbf{q}) \sum_{I,J=1,2} \sum_{\epsilon_n=\pm 1} F_{JI}^{\epsilon_n} L_{IJ}^{\epsilon_n}(t)$$

- ▶ Coefficients F depend on Yukawa couplings, thermal distributions of lepton and Higgs, resummed ret/adv propagators and initial conditions

$$\begin{aligned} F_{JI}^{\epsilon_n} &= \sum_{ijkl=1,2} (h^\dagger h)_{ji} \left(\left(\frac{1}{2} + f_\phi(q) \right) + \epsilon_2 \epsilon_3 \left(\frac{1}{2} - f_\ell(k) \right) \right) \text{tr} \left[P_L(|\mathbf{k}| \gamma_0 + \epsilon_2 \mathbf{k} \gamma) \right. \\ &\quad \times \left. \left(S_{RI}^{ik\epsilon_4} \gamma_0 \Delta S_{F\mathbf{p}}^{kl}(0,0) \gamma_0 S_{AJ}^{lj\epsilon_1} - \bar{S}_{RI}^{jk\epsilon_4} \gamma_0 \Delta \bar{S}_{F\mathbf{p}}^{kl}(0,0) \gamma_0 \bar{S}_{AJ}^{li\epsilon_1} \right) \right] \end{aligned}$$

Result for the lepton asymmetry

$$n_L(t) = \int \frac{d^3 p}{(2\pi)^9} \frac{d^3 q}{2q} \frac{d^3 k}{2k} (2\pi)^3 \delta(\mathbf{p} - \mathbf{k} - \mathbf{q}) \sum_{I,J=1,2} \sum_{\epsilon_n=\pm 1} F_{JI}^{\epsilon_n} L_{IJ}^{\epsilon_n}(t)$$

- ▶ Coefficients F depend on Yukawa couplings, thermal distributions of lepton and Higgs, resummed ret/adv propagators and initial conditions

$$\begin{aligned} F_{JI}^{\epsilon_n} &= \sum_{ijkl=1,2} (h^\dagger h)_{ji} \left(\left(\frac{1}{2} + f_\phi(q) \right) + \epsilon_2 \epsilon_3 \left(\frac{1}{2} - f_\ell(k) \right) \right) \text{tr} \left[P_L(|\mathbf{k}| \gamma_0 + \epsilon_2 \mathbf{k} \gamma) \right. \\ &\quad \times \left. \left(S_{RI}^{ik\epsilon_4} \gamma_0 \Delta S_{F\mathbf{p}}^{kl}(0,0) \gamma_0 S_{AJ}^{lj\epsilon_1} - \bar{S}_{RI}^{jk\epsilon_4} \gamma_0 \Delta \bar{S}_{F\mathbf{p}}^{kl}(0,0) \gamma_0 \bar{S}_{AJ}^{li\epsilon_1} \right) \right] \end{aligned}$$

- ▶ Time-dependence: flavor diagonal and off-diagonal contributions:

$$\begin{aligned} L_{II}^\pm(t) &= \frac{1 - e^{-\Gamma_{pl} t}}{\Gamma_{pl}} \text{Re} \left(\frac{\Gamma_{\ell\phi}}{(\omega_{pl} - k - q + i\Gamma_{pl}/2)^2 + \Gamma_{\ell\phi}^2/4} \right) + \mathcal{O}(\Gamma_{pl}^0) \\ L_{21}^\pm(t) &= \frac{1 - e^{\mp i(\omega_{p1} - \omega_{p2})t} e^{-(\Gamma_{p1} + \Gamma_{p2})t/2}}{\Gamma_{p1} + \Gamma_{p2} \pm 2i(\omega_{p1} - \omega_{p2})} \text{Re} \left(\frac{\Gamma_{\ell\phi}}{(\omega_{p1} - k - q \pm i\Gamma_{p1}/2)^2 + \Gamma_{\ell\phi}^2/4} \right) \end{aligned}$$

Hierarchical limit

$$n_L(t) = \frac{\text{Im}[(h^\dagger h)_{12}^2]}{8\pi} \frac{M_1}{M_2} \int \frac{d^3 p d^3 q d^3 k}{(2\pi)^9 \omega_{p1} 2q 2k} 4k \cdot p_1 \\ (2\pi)^3 \delta(\mathbf{p} - \mathbf{k} - \mathbf{q}) \times \text{Re} \frac{\Gamma_{\ell\phi}}{(\omega_{p1} - k - q + i\Gamma_{p1}/2)^2 + \Gamma_{\ell\phi}^2/4} \\ \times (1 + f_\phi(q) - f_\ell(k)) f_{FD}(\omega_{p1}) \frac{1 - e^{-\Gamma_{p1} t}}{\Gamma_{p1}}$$

$$n_L^{Boltzmann}(t) = \frac{\text{Im}[(h^\dagger h)_{12}^2]}{8\pi} \frac{M_1}{M_2} \int \frac{d^3 p d^3 q d^3 k}{(2\pi)^9 \omega_{p1} 2q 2k} 4k \cdot p_1 \\ (2\pi)^3 \delta(\mathbf{p} - \mathbf{k} - \mathbf{q}) \times 2\pi \delta(\omega_{p1} - k - q) \\ \times (1 + f_\phi(q) - f_\ell(k)) f_{FD}(\omega_{p1}) \frac{1 - e^{-\Gamma_{p1} t}}{\Gamma_{p1}} .$$

The ‘width’ of lepton and Higgs $\Gamma_{\ell\phi} = \Gamma_\ell + \Gamma_\phi$ leads to a replacement of the on-shell delta function in the Boltzmann equations by a Breit-Wigner curve, in accordance with *Anisimov, Buchmüller, Drewes, Mendizabal Annals Phys. 326 (2011) 1998*

The coherent contributions are suppressed with Γ_{p1}/ω_{p2}

- Regulator $M_1 \Gamma_1 - M_2 \Gamma_2$ is confirmed

Degenerate case

Analytical result for $\text{Re}(h^\dagger h)_{12} \ll (h^\dagger h)_{ii}$ (mass basis \sim 'int. basis')

$$n_L(t) = \frac{\text{Im}[(h^\dagger h)_{12}^2]}{8\pi} \frac{M_1 M_2 (M_2^2 - M_1^2)}{(M_2^2 - M_1^2)^2 + (M_1 \Gamma_1 - M_2 \Gamma_2)^2} \int \frac{d^3 p d^3 q d^3 k}{(2\pi)^9 \omega_p 2q 2k} 4k \cdot p \\ \times (2\pi)^3 \delta(\mathbf{p} - \mathbf{k} - \mathbf{q}) \frac{\Gamma_{\ell\phi}}{(\omega_p - k - q)^2 + \Gamma_{\ell\phi}^2/4} (1 + f_\phi - f_\ell) f_{FD}(\omega_p) \\ \times \left[\sum_{l=1,2} \frac{1 - e^{-\Gamma_{pl} t}}{\Gamma_{pl}} - 4 \text{Re} \left(\frac{1 - e^{-i(\omega_{p1} - \omega_{p2})t} e^{-(\Gamma_{p1} + \Gamma_{p2})t/2}}{\Gamma_{p1} + \Gamma_{p2} + 2i(\omega_{p1} - \omega_{p2})} \right) \right]$$

$$n_L^{Boltzmann}(t) = \frac{\text{Im}[(h^\dagger h)_{12}^2]}{8\pi} \frac{M_1 M_2 (M_2^2 - M_1^2)}{(M_2^2 - M_1^2)^2 + (M_1 \Gamma_1 - M_2 \Gamma_2)^2} \int \frac{d^3 p d^3 q d^3 k}{(2\pi)^9 \omega_p 2q 2k} 4k \cdot p \\ \times (2\pi)^3 \delta(\mathbf{p} - \mathbf{k} - \mathbf{q}) 2\pi \delta(\omega_p - k - q) (1 + f_\phi - f_\ell) f_{FD}(\omega_p) \\ \times \left[\sum_{l=1,2} \frac{1 - e^{-\Gamma_{pl} t}}{\Gamma_{pl}} \right]$$

- ▶ Regulator $M_1 \Gamma_1 - M_2 \Gamma_2$ is confirmed
- ▶ Additional oscillating contribution due to coherent $N_1 - N_2$ transitions

Flavoured leptogenesis

$$\mathcal{L}_{int} = -\bar{\ell}_a \tilde{\phi} h_{ai} P_R N_i - \textcolor{red}{y_{ab} \bar{e}_{R,a} \phi \ell_b} \quad y_{ab} = \text{diag}(m_e m_\mu m_\tau) / v_{EW}$$

$$q_\ell^{ab} = (\delta n_\ell^+ - \delta n_\ell^-)^{ab}, \quad \delta n_\ell^{ab} = \int \frac{d^3 k}{(2\pi)^3} (f_\ell^{ab} - f_{\ell,eq}^{ab}) = \mu_{ab} \frac{T^2}{12}, \quad \Xi = \dot{U} U^\dagger$$

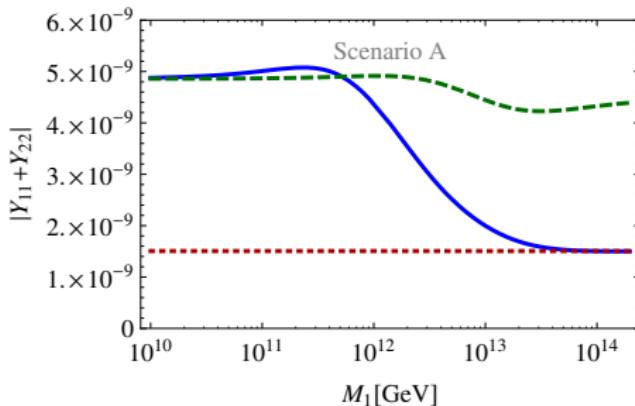

$$\begin{aligned} \partial_t q_\ell + 3Hq_\ell &= \textcolor{blue}{S + [\Xi, q] - \{W, q\}} - \Gamma_{LR} (y^\dagger y q_\ell + q_\ell^\dagger y^\dagger y - y^\dagger q_R y - y^\dagger q_R^\dagger y) \\ \partial_t q_R + 3Hq_R &= -\Gamma_{LR} (y y^\dagger q_R + q_R^\dagger y y^\dagger - y q_\ell y^\dagger - y q_\ell^\dagger y^\dagger) \end{aligned}$$

Beneke, Garbrecht, Fidler, Herranen, Schwaller 1007.4783

- ▶ Γ_{LR} -term decohere $a \neq b$ terms in $y=\text{diag}$ basis
and equilibrate $q_{\ell,ab}$, $q_{R,ab}$
- ▶ Gauge interactions impose $\delta n^+ + \delta n^- = 0 \Rightarrow$ no oscillations

Flavoured leptogenesis

- Unflavoured $\Gamma_{LR} \ll H \Rightarrow$ project on flavor that couples to N_1
- Flavoured $\Gamma_{LR} \gg H \Rightarrow$ project on flavor that couples to τ (and \perp or e, μ)
- Full $\Gamma_{LR} \sim H$, off-diagonal comp. of q_ℓ^{ab} important

Flavoured leptogenesis

Source term $N_1 \rightarrow \ell_a \phi$ ($\mathcal{O}(h^4)$)

$$S_{ab} = \sum_j \left[\underbrace{(h_{a1} h_{1c}^T h_{cj}^* h_{jb} - h_{b1}^* h_{1c}^\dagger h_{cj} h_{ja}^*)}_{\text{Tr} \propto \epsilon_1} S^{LNV} + \underbrace{(h_{a1} h_{1c}^\dagger h_{cj} h_{jb} - h_{b1}^* h_{1c}^T h_{cj}^* h_{ja}^*)}_{\text{Tr} = 0} S^{LFV} \right] \propto T^2$$

Garbrecht, Drewes 12

Washout $\ell_a \phi \rightarrow N_1$

$$W_{ab} \propto h_{a1} h_{1a}^\dagger$$

- ▶ Potentially large effects for ultrarelativistic N 's, which decay after sphaleron freeze-out *Garbrecht, Drewes 12, cf. also Pilaftsis et. al. 14*
- ▶ Use freedom in h_{ai} to 'hide' asymmetry from washout when $N_{1,2,3}$ have comparable masses \Rightarrow possibility of GeV-scale leptogenesis w/o need for resonant enhancement *Garbrecht, Drewes 14*

Two strategies

1. Derive kinetic equations

$$S(t, k) = \int ds e^{iks} S(\textcolor{blue}{t} + \textcolor{red}{s}/2, \textcolor{blue}{t} - \textcolor{red}{s}/2)$$

Gradient expansion $\partial_t \partial_k \sim \frac{\text{slow}}{\text{fast}} \sim \frac{\Gamma, H, y^2 T, \Delta M}{M, T}$

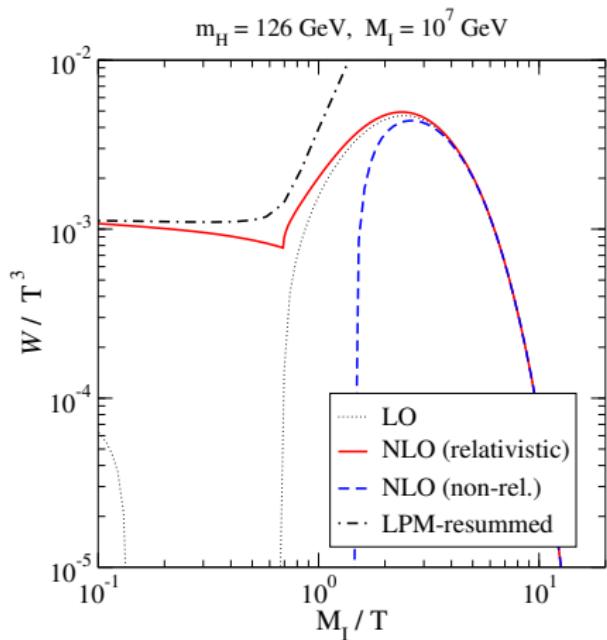

$$\int dz \Sigma(x, z) S(z, y) \rightarrow \Sigma(t, k) S(t, k) + \frac{i}{2} \left(\frac{\partial \Sigma}{\partial t} \frac{\partial S}{\partial k} - \frac{\partial \Sigma}{\partial k} \frac{\partial S}{\partial t} \right)$$

On-shell limit

$$\begin{aligned} S_\rho^{ij}(t, k) &\rightarrow U^{in}(t) \delta^{nm}(\not{k} - M_n) \delta(k^2 - M_n^2(t)) U^{\dagger nj}(t) \\ &\rightarrow \delta^{ij}(\not{k} - M_{av}) \delta(k^2 - M_{av}^2) \\ S_F^{ij}(t, k) &\rightarrow \left(\frac{1}{2} \delta^{ij} \delta_{hh'} - f_{hh'}^{ij}(t, \mathbf{k}) \right) u_h(\mathbf{k}) \bar{u}_{h'}(\mathbf{k}) \delta(k^2 - M_{av}^2) \end{aligned}$$

2. Solve two-time KB-eqs. for some simplified setup to study generation of the asymmetry (thermal bath)

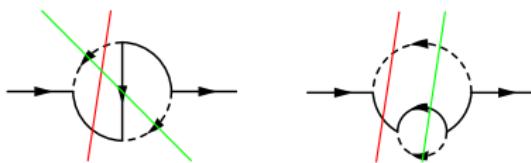

Washout rate

Washout: corr. start already at $\mathcal{O}(g)$ (leading corr. to rel. between μ and n)

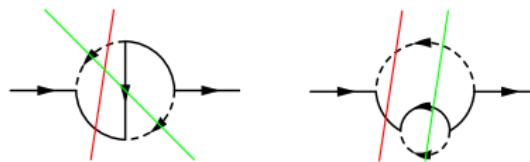

Hierarchical limit $M_1 \lesssim M_{2,3}$

$$\begin{aligned}\partial_t n_L &= 16\pi (h^\dagger h)_{11} \int \frac{d^3 p d^3 q d^3 k}{(2\pi)^9 8\omega_p k^0 q^0} \Theta(p_0)(2\pi)^4 \delta(k - p - q) \\ &\times (f_N(p)(1 - f_\ell(k))(1 + f_\phi(q) - (1 - f_N(p))f_\ell(k)f_\phi(q)) \\ &\times \epsilon_1(t, k, p, q)\end{aligned}$$

Hierarchical limit $M_1 \lesssim M_{2,3}$

$$\begin{aligned}\partial_t n_L &= 16\pi (h^\dagger h)_{11} \int \frac{d^3 p d^3 q d^3 k}{(2\pi)^9 8\omega_p k^0 q^0} \Theta(p_0)(2\pi)^4 \delta(k - p - q) \\ &\quad \times (f_N(p)(1 - f_\ell(k))(1 + f_\phi(q) - (1 - f_N(p))f_\ell(k)f_\phi(q)) \\ &\quad \times \epsilon_1(t, k, p, q)\end{aligned}$$

$$\begin{aligned}\epsilon_i^{\text{vertex}}(t, k, p, q) &= \sum_j \frac{\text{Im}(h^\dagger h)_{ij}^2}{8\pi(h^\dagger h)_{11}} \int d\Pi_{k_1} d\Pi_{k_2} d\Pi_{k_3} \\ &\quad \times (2\pi)^4 \delta(k + k_1 + k_2)(2\pi)^4 \delta(k_2 - k_3 + q) \\ &\quad \times \text{tr}[D_\rho^\ell(t, k_1) D_F^\phi(t, k_2) D_h^{N_j}(t, k_3) + \{k_1 \leftrightarrow k_2\} \\ &\quad + D_h^\ell(t, k_1) D_F^\phi(t, k_2) D_\rho^{N_j}(t, k_3) + \{k_1 \leftrightarrow k_2\} \\ &\quad + D_\rho^\ell(t, k_1) D_h^\phi(t, k_2) D_F^{N_j}(t, k_3) - \{k_1 \leftrightarrow k_2\}]\end{aligned}$$

\Rightarrow consistent equations w/o need for RIS subtractions

works also for arbitrary $f \neq f_{eq}$
