MTCA Workshop 10th December 2015, DESY

# MTCA4U — The DESY MicroTCA.4 User Tool Kit

## Goal

Provide a tool kit to facilitate the development for MicroTCA.4 based control applications.

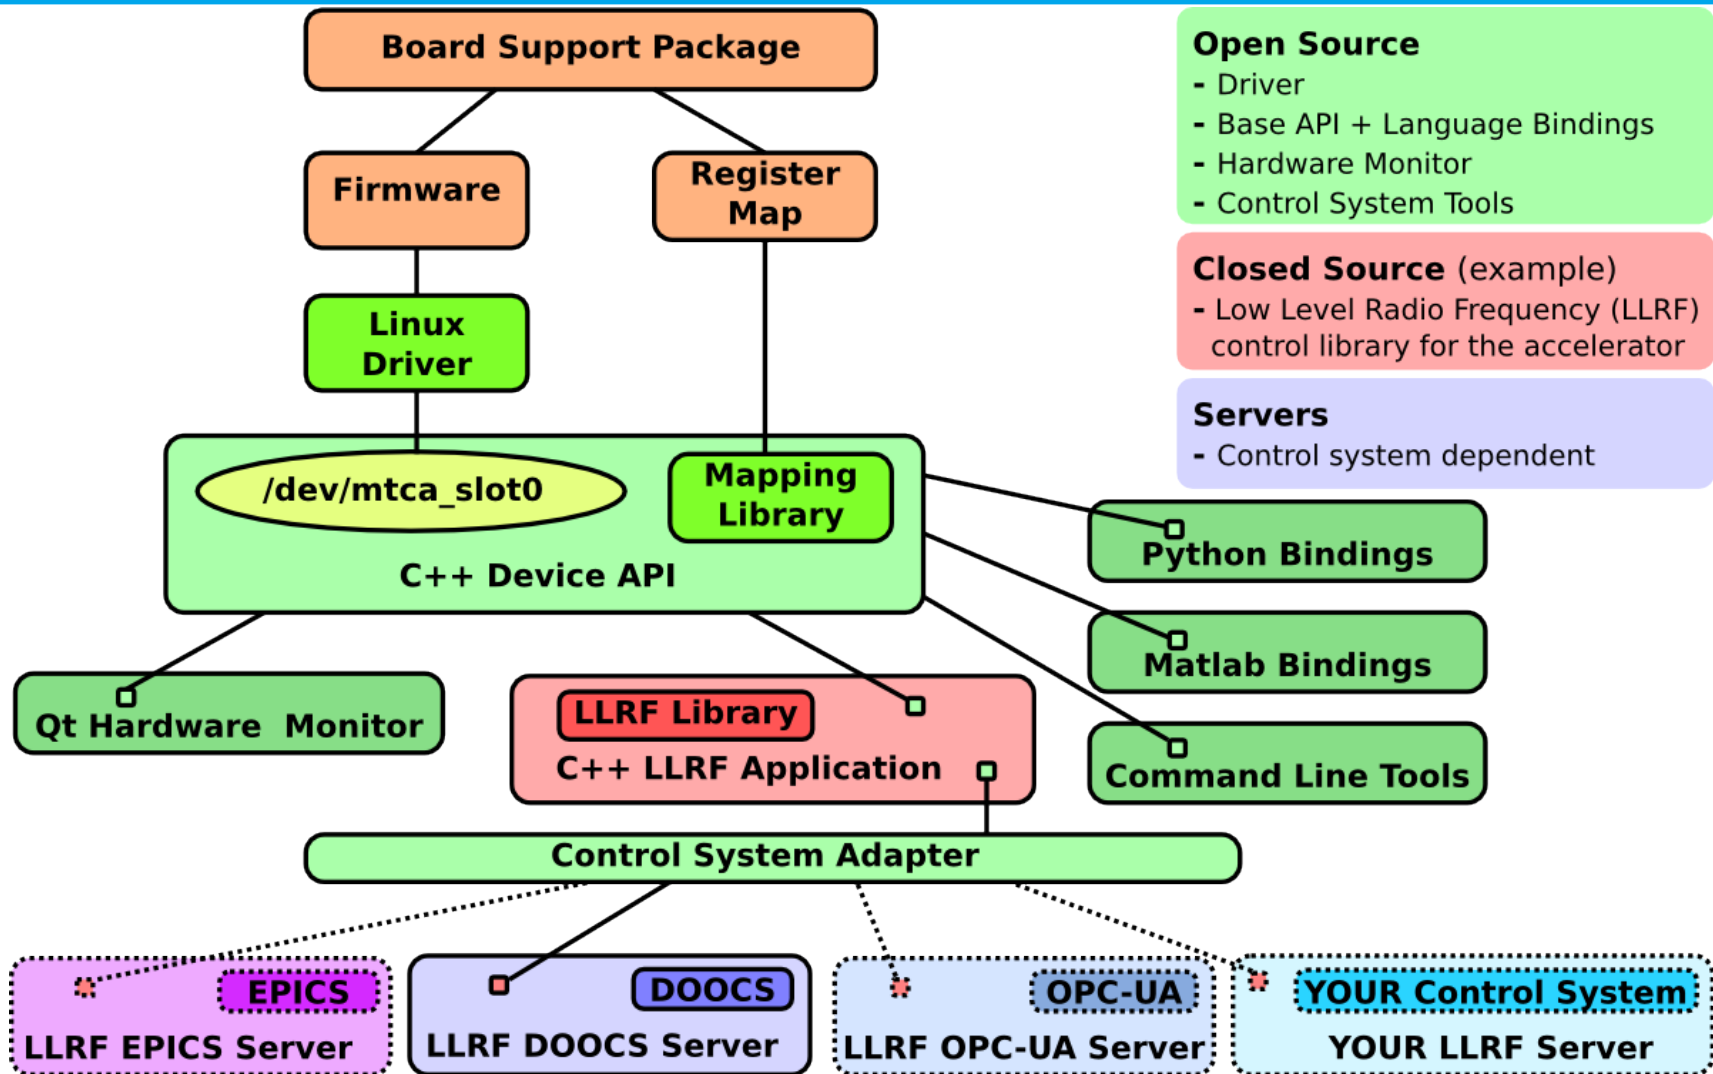

MTCA4U comprises

- ◆ Linux drivers for PCIeexpress
- ◆ Intuitive C++ API
- ◆ Tools for easy integration into control systems
- ◆ Board-specific classes for implementations used at DESY

## Requirements

- ◆ Independent from the control system
- ◆ Universal and extensible
- ◆ Base version open source (compile on many distributions)
- ◆ Board-specific classes can be closed source (protection of intellectual property)

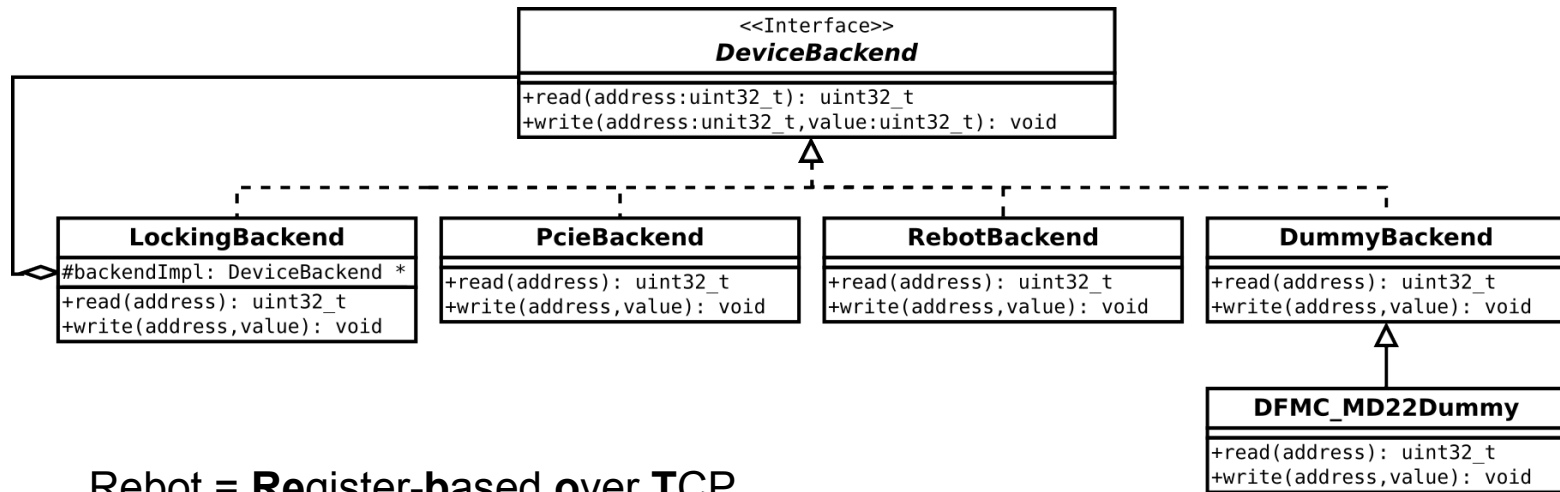

# Design Concept

# Device Backends for Hardware Access

## Features

- ◆ C++ API has an abstract DeviceBackend interface
  - ◆ Different implementation for specific hardware
- ◆ Easy extensibility by adding new Backends
- ◆ Device backends can be added at run time (factory with plug-in mechanism)

Rebot = **R**egister-based **o**ver **T**CP

# The Backend Factory

## Features

- ◆ Abstract the creation of device backends.
  - ◆ Devices are created using alias names.
- ◆ New backends can be added through plug-in mechanism.
- ◆ Factory remains unchanged.
- ◆ Factory uses the URI format based on the Standard Device Model suggested by Augustus P. Lowell.  
(sdm work still in progress in the PICMG SW working group)

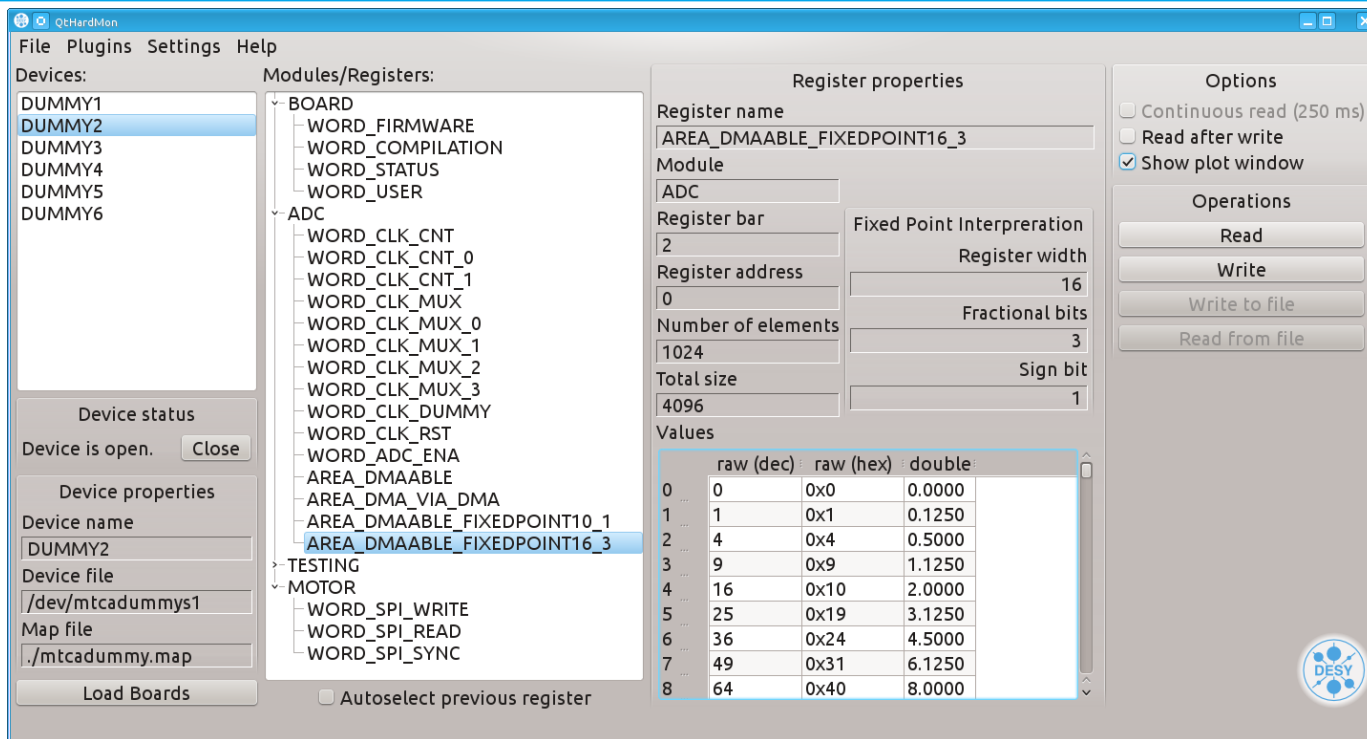

## URI Scheme To Describe Backend Types

- ◆ Device Name Mapping
- ◆ Common format for portability across different platforms
- ◆ Specify interfaces, instances and parameters to access the hardware

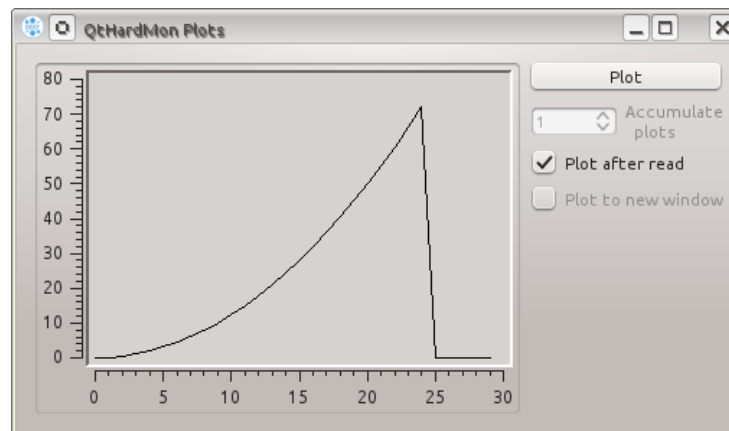

# Backend Factory in Action

# QtHardMon — A GUI for the Basic API

- Display devices and registers by name
- Show and modify register content
- Basic plotting functionality

## Features

- ◆ Uses new Device Factory.
- ◆ Easy monitoring of device from command prompt.
- ◆ Fast application development through scripting.
- ◆ All mtca4u device functions including reading and writing to registers

```
mskpcx18356% mtca4u help
```

```
mtca4u command line tools, version 00.07.00
```

```
Available commands are:
```

help		Prints the help text
version		Prints the tools version
info		Prints all devices
device_info	Board Module	Prints the register of devices
register_info	Board Module Register	Prints the register infos
register_size	Board Module Register	Prints the register infos
read	Board Module Register [offset] [elements] [raw   hex]	Read data from Board
write	Board Module Register Value [offset]	Write data to Board

# Matlab Tools and Python Bindings

## Matlab

```
>> struck_adc = mtca4u('SIS8300');  
>> struck_adc.read('BOARD', 'WORD_COMPILATION')  
  
ans =  
  
      9  
  
>> struck_adc.write('ADC', 'WORD_ADC_ENA', 1)  
fx >>
```

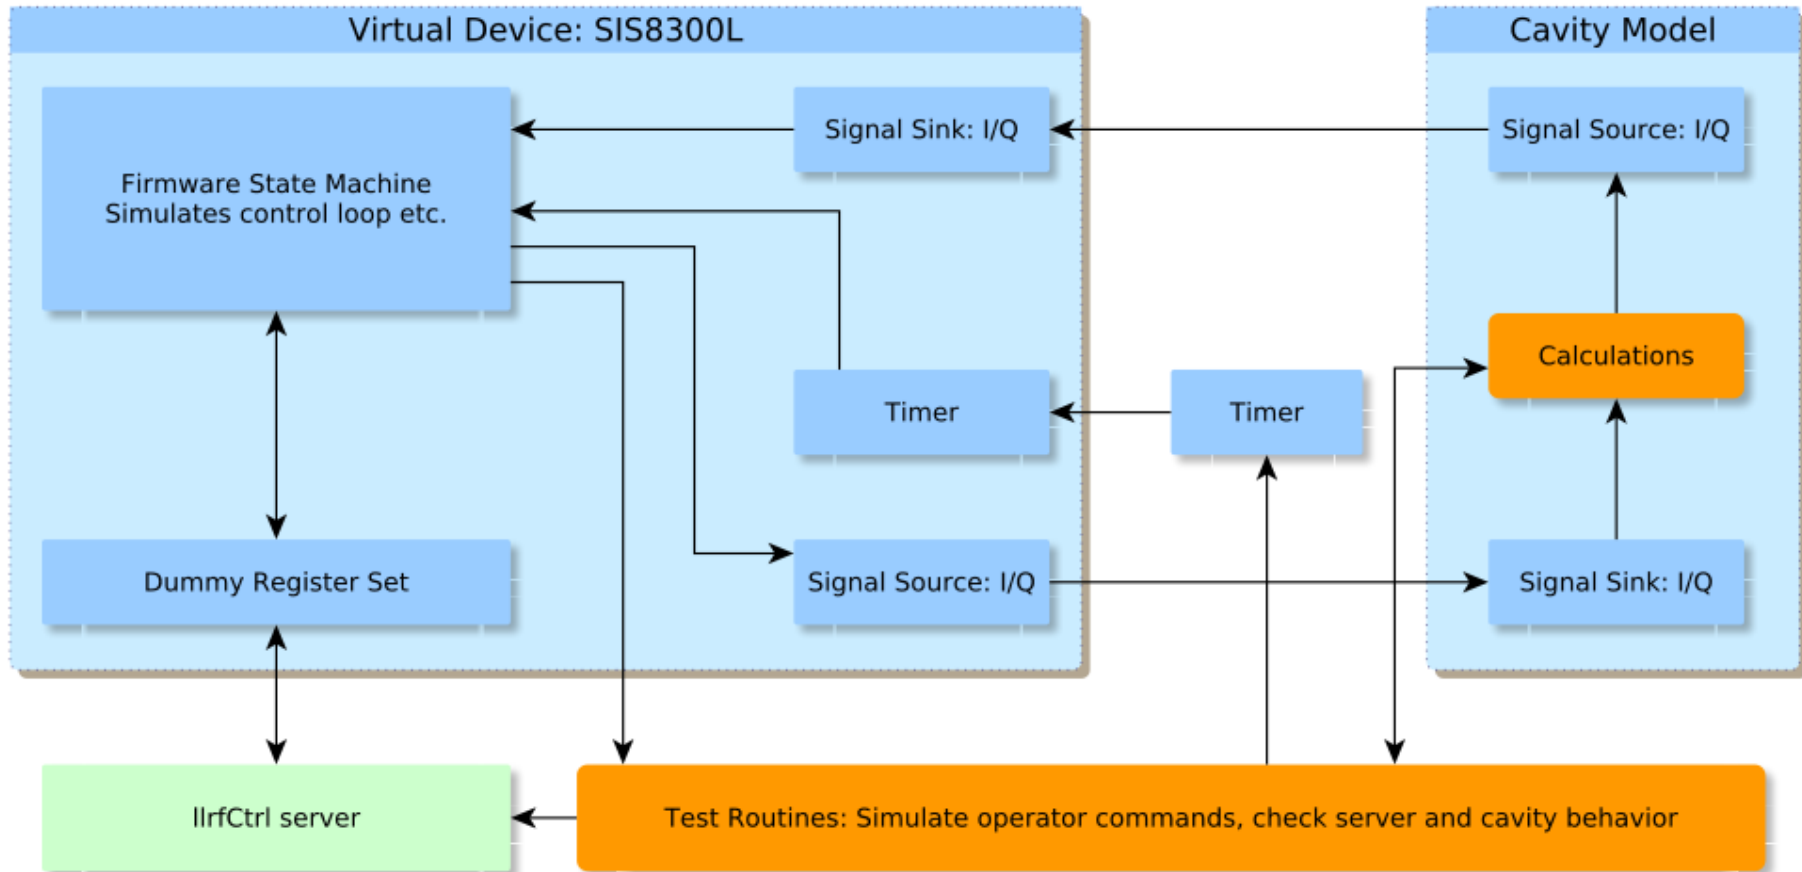

## Python

```
In [1]: import mtca4u  
  
In [2]: struck_adc = mtca4u.Device("SIS8300")  
  
In [3]: struck_adc.read('BOARD', 'WORD_COMPILATION')  
Out[3]: array([ 9.], dtype=float32)  
  
In [4]: struck_adc.write('ADC', 'WORD_ADC_ENA', 1)  
  
In [5]: □
```

## Features

- Developed as part of MTCA4U package
- A virtual device can be implemented and inserted in place of the actual device.
- Automated test can be performed to ensure software quality.
- e.g, a simple cavity model can be connected for realistic tests.

# Virtual Lab at Work

# Control System Adapter

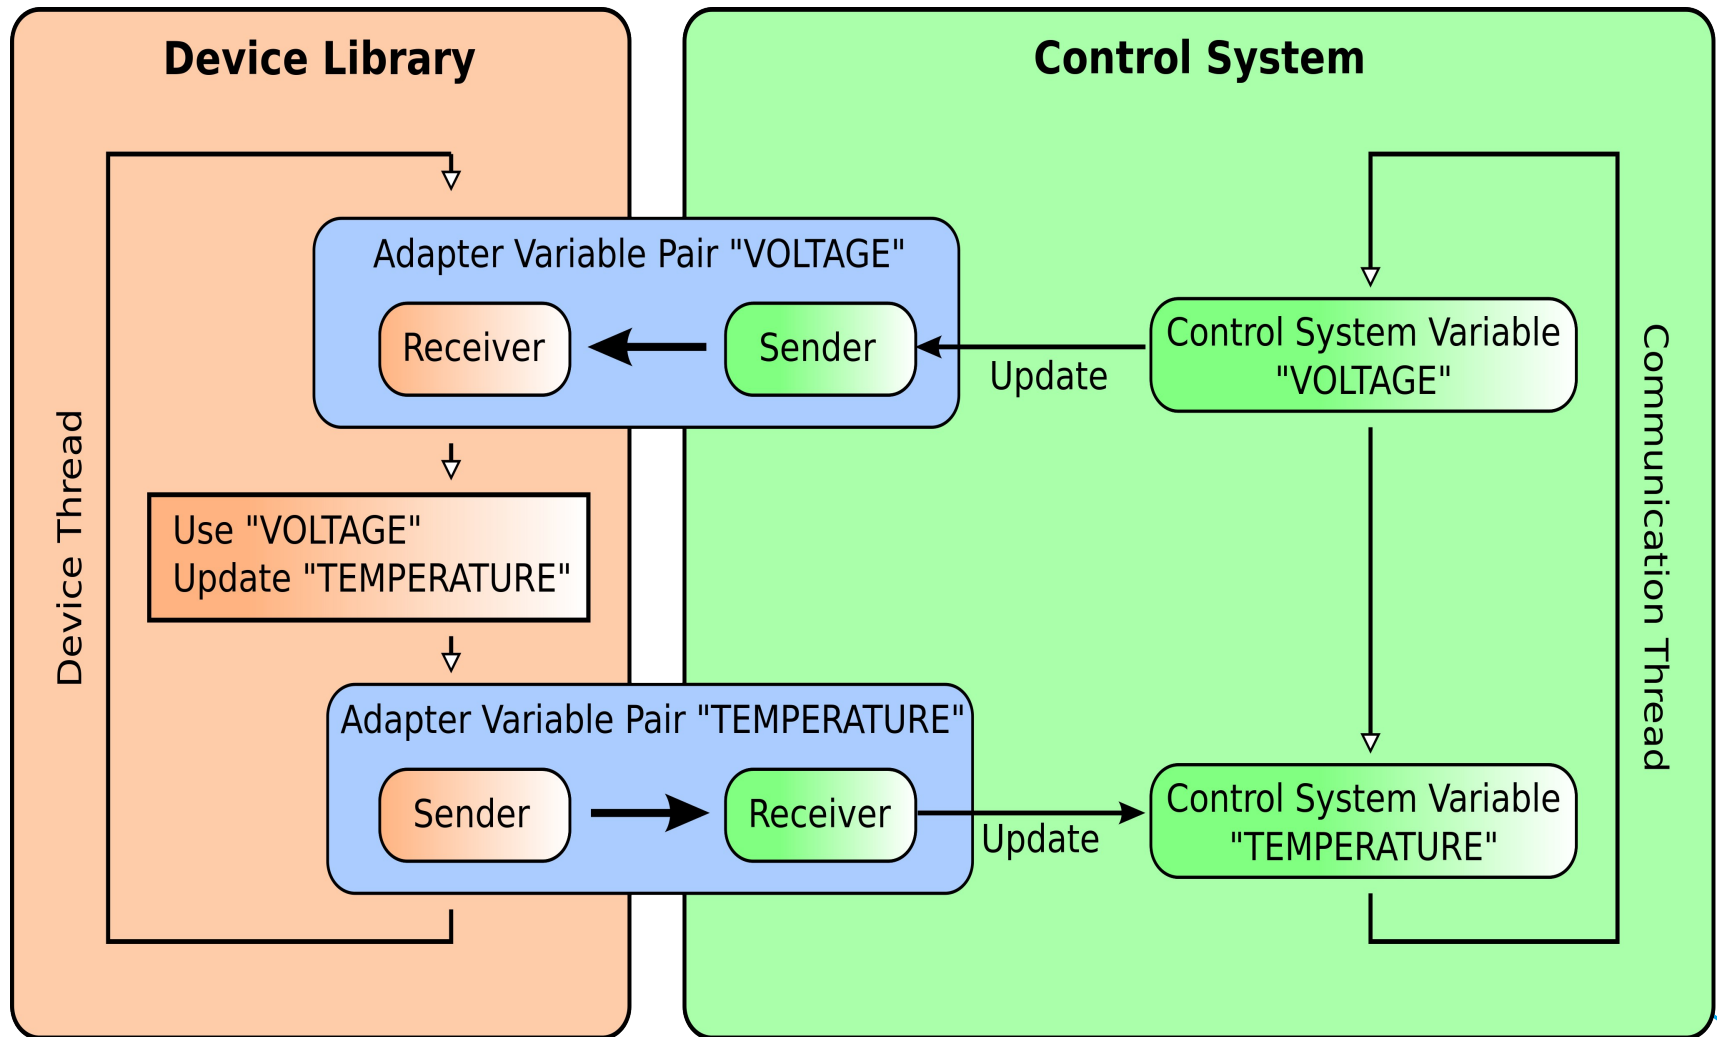

## Goal

Make use of complex control algorithms with different control systems.

## Features

- Allows application code to access process variables independent of control system.
- Thread safe.
- Real Time compliant.
- Implementations for DOOCS and EPICS are ready to use.
- Planned: support for UPC-UA

# Control System Adapter Design

## MTCA4U

- ◆ Easy hardware access for MicroTCA.4
  - ◆ C++ API
  - ◆ GUI and bindings to scripting languages
- ◆ New BackendFactory
- ◆ Virtual Lab Framework
- ◆ Control System Adapters for DOOCS and EPICS are ready.
