

Dark Matter searches with the MAGIC telescopes

Monday, August 27, 2018 2:00 PM (0:20)

Abstract content

Indirect searches for dark matter with the ground-based MAGIC telescopes will be reviewed. Different targets with a large expected dark matter content, such as galaxy clusters and dwarf satellite galaxies, allow to constrain dark-matter annihilation/decay processes up to the TeV mass scale. Latest results from deep observations of the galaxy cluster Perseus and the dwarf spheroidal Ursa Major II will be presented.

Primary author(s) : Dr. VAZQUEZ ACOSTA, Monica (Instituto de Astrofisica de Canarias)

Co-author(s) : Dr. DORO, Michele (Padova); Dr. GAUG, Markus (UAB); Dr. GIAMMARIA, Paola (Rome, INAF); Dr. LOMBARDI, Saverio (Rome, INAF); Mrs. MAGGIO, Camilla (UAB); Mr. NINCI, Daniele (IFAE); Dr. PALACIO, Joaquim (IFAE); Dr. RICO, Javier (IFAE)

Presenter(s) : Dr. VAZQUEZ ACOSTA, Monica (Instituto de Astrofisica de Canarias)

Session Classification : Dark Matter

Track Classification : Dark Matter
