

# Virtual depth by active background suppression: The cosmic muon induced background of GERDA Phase II

Christoph Wiesinger<sup>1,a</sup>, Luciano Pandola<sup>2</sup>, Stefan Schönert<sup>1</sup>

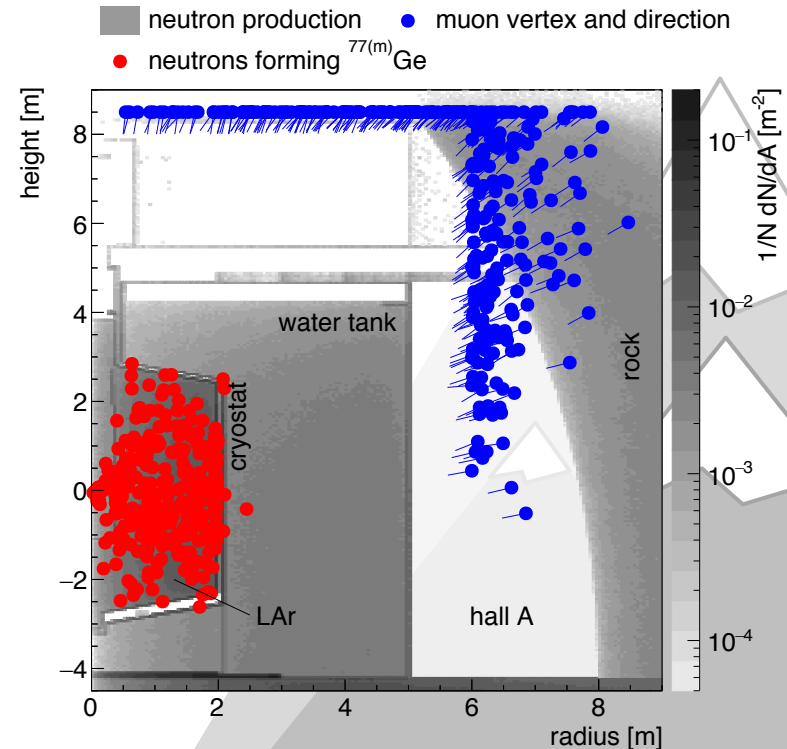

<sup>1</sup>Physik Department E15, Technische Universität München, Garching, Germany, <sup>2</sup>INFN Laboratori Nazionali del Sud, Catania, Italy, <sup>a</sup>e-mail: [christoph.wiesinger@tum.de](mailto:christoph.wiesinger@tum.de)

- non-standard background source for next generation **background-free**  $0\nu\beta\beta$  searches
- deep underground **in-situ production** of radioactive isotopes by cosmic muons

**“How deep is deep enough?”**

- $^{76}\text{Ge}(n,\gamma)^{77(m)}\text{Ge}$  is critical cosmogenic component for  $0\nu\beta\beta$  searches with germanium [1]
- simulation of GERDA Phase II [2] as proxy for LEGEND at LNGS [3]

**“Capture of neutrons from inner cryostat volume appears prompt and at non-thermal energies”**

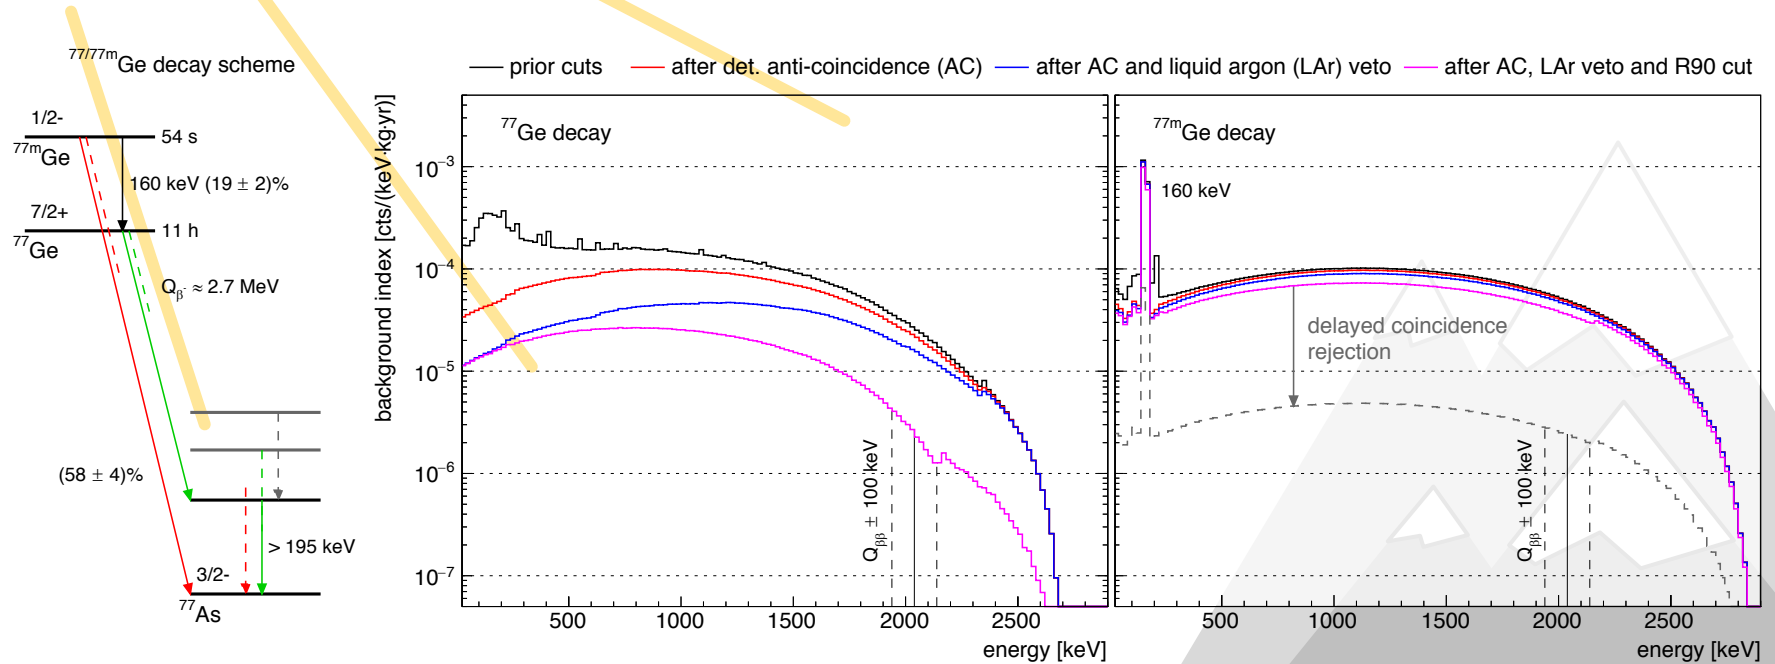

- $^{77(m)}\text{Ge}$  production rate:  
 **$(0.21 \pm 0.01)$  nuclei/(kg·yr)**

# Virtual depth by active background suppression: The cosmic muon induced background of GERDA Phase II

Christoph Wiesinger<sup>1,a</sup>, Luciano Pandola<sup>2</sup>, Stefan Schönert<sup>1</sup>

<sup>1</sup>Physik Department E15, Technische Universität München, Garching, Germany, <sup>2</sup>INFN Laboratori Nazionali del Sud, Catania, Italy, <sup>a</sup>e-mail: [christoph.wiesinger@tum.de](mailto:christoph.wiesinger@tum.de)

- **distinct features** in  $^{77(m)}\text{Ge}$  production and decay enable active reduction
  - large neutron multiplicities allow to tag accompanying **sibling captures** (e.g.  $^{41}\text{Ar}$ )
  - sequence of coincidence cuts reduces the muon induced  $^{77(m)}\text{Ge}$  background from  $(4.0 \pm 0.4) \cdot 10^{-5}$  to  $(2.7 \pm 0.3) \cdot 10^{-6}$  cts/(keV·kg·yr)
  - suppression can be translated into **effective muon flux reduction**
- “The virtual overburden of GERDA Phase II corresponds to about 5000 m.w.e”
